

Low Power Stereo Audio CODEC for Portable Audio/Telephony

FEATURES

- **Stereo Audio DAC**
 - 100-dBA Signal-to-Noise Ratio
 - 16/20/24/32-Bit Data
 - Supports Rates From 8 kHz to 96 kHz
 - 3D/Bass/Treble/EQ/De-emphasis Effects
- **Stereo Audio ADC**
 - 92-dBA Signal-to-Noise Ratio
 - Supports Rates From 8 kHz to 96 kHz
- **Ten Audio Input Pins**
 - Programmable in Single-Ended or Fully Differential Configurations
 - 3-State Capability for Floating Input Configurations
- **Seven Audio Output Drivers**
 - Stereo 8-Ω, 500-mW/Channel Speaker Drive Capability
 - Stereo Fully Differential or Single-Ended Headphone Drivers
 - Fully Differential Stereo Line Outputs
 - Fully Differential Mono Output
- **Low Power: 14-mW Stereo 48-kHz Playback With 3.3-V Analog Supply**
- **Programmable Input/Output Analog Gains**
- **Automatic Gain Control (AGC) for Record**
- **Programmable Microphone Bias Level**
- **Programmable PLL for Flexible Clock Generation**
- **Control Bus Selectable SPI or I²C**
- **Audio Serial Data Bus Supports I²S, Left/Right-Justified, DSP, and TDM Modes**
- **Alternate Serial PCM/I²S Data Bus for Easy Connection to Bluetooth™ Module**
- **Digital Microphone Input Support**
- **Extensive Modular Power Control**
- **Power Supplies:**
 - Analog: 2.7 V–3.6 V.
 - Digital Core: 1.65 V–1.95 V
 - Digital I/O: 1.1 V–3.6 V
- **Packages: 5 × 5 mm 80-VFBGA;**

7 × 7 mm 48-QFN

DESCRIPTION

The TLV320AIC33 is a low power stereo audio codec with stereo headphone amplifier, as well as multiple inputs and outputs programmable in single-ended or fully differential configurations. Extensive register-based power control is included, enabling stereo 48-kHz DAC playback as low as 14 mW from a 3.3-V analog supply, making it ideal for portable battery-powered audio and telephony applications.

The record path of the TLV320AIC33 contains integrated microphone bias, digitally controlled stereo microphone preamplifier, and automatic gain control (AGC), with mix/mux capability among the multiple analog inputs. The playback path includes mix/mux capability from the stereo DAC and selected inputs, through programmable volume controls, to the various outputs.

The TLV320AIC33 contains four high-power output drivers as well as three fully differential output drivers. The high-power output drivers are capable of driving a variety of load configurations, including up to four channels of single-ended 16-Ω headphones using ac-coupling capacitors, or stereo 16-Ω headphones in a capacitorless output configuration. In addition, pairs of drivers can be used to drive 8-Ω speakers in a BTL configuration at 500 mW per channel.

The stereo audio DAC supports sampling rates from 8 kHz to 96 kHz and includes programmable digital filtering in the DAC path for 3D, bass, treble, midrange effects, speaker equalization, and de-emphasis for 32-kHz, 44.1-kHz, and 48-kHz rates. The stereo audio ADC supports sampling rates from 8 kHz to 96 kHz and is preceded by programmable gain amplifiers providing up to +59.5-dB analog gain for low-level microphone inputs.

The serial control bus supports SPI or I²C protocols, while the serial audio data bus is programmable for I²S, left/right-justified, DSP, or TDM modes. A highly programmable PLL is included for flexible clock generation and support for all standard audio rates from a wide range of available MCLKs, varying from 512 kHz to 50 MHz, with special attention paid to the most popular cases of 12-MHz, 13-MHz, 16-MHz, 19.2-MHz, and 19.68-MHz system clocks.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

MicroStar Junior is a trademark of Texas Instruments.
Bluetooth is a trademark of Bluetooth SIG, Inc..

DESCRIPTION (CONTINUED)

The TLV320AIC33 operates from an analog supply of 2.7 V–3.6 V, a digital core supply of 1.65 V–1.95 V, and a digital I/O supply of 1.1 V–3.6 V. The device is available in 5 × 5-mm, 80-ball MicroStar Junior™ BGA and 7 × 7-mm, 48-lead QFN.

TERMINAL FUNCTIONS

TERMINAL			DESCRIPTION
BGA BALL	QFN	NAME	
A2	13	MICBIAS	Microphone Bias Voltage Output
A1	14	MIC3R	MIC3 Input (Right or Multifunction)
C2,D2	15	AVSS_ADC	Analog ADC Ground Supply, 0 V
B1,C1	16,17	DRVDD	ADC Analog and Output Driver Voltage Supply, 2.7 V–3.6 V
D1	18	HPLOUT	High-Power Output Driver (Left Plus)
E1	19	HPLCOM	High-Power Output Driver (Left Minus or Multifunctional)
E2,F2	20,21	DRVSS	Analog Output Driver Ground Supply, 0 V
F1	22	HPRCOM	High-Power Output Driver (Right Minus or Multifunctional)
G1	23	HPROUT	High-Power Output Driver (Right Plus)
H1	24	DRVDD	ADC Analog and Output Driver Voltage Supply, 2.7 V– 3.6 V

TERMINAL FUNCTIONS (continued)

TERMINAL			DESCRIPTION
BGA BALL	QFN	NAME	
J1	25	AVDD	Analog DAC Voltage Supply, 2.7 V–3.6 V
G2,H2	26	AVSS_DAC	Analog DAC Ground Supply, 0 V
J2	27	MONO_LOP	Mono Line Output (Plus)
J3	28	MONO_LOM	Mono Line Output (Minus)
J4	29	LEFT_LOP	Left Line Output (Plus)
J5	30	LEFT_LOM	Left Line Output (Minus)
J6	31	RIGHT_LOP	Right Line Output (Plus)
J7	32	RIGHT_LOM	Right Line Output (Minus)t
H8	33	RESET	Reset
J8	34	GPIO2	General-Purpose Input/Output #2 (Input/Output) / Digital Microphone Data Input / PLL Clock Input / Audio Serial Data Bus Bit Clock Input/Output
J9	35	GPIO1	General-Purpose Input/Output #1 (Input/Output) / PLL/Clock Mux Output / Short Circuit Interrupt / AGC Noise Flag / Digital Microphone Clock Audio Serial Data Bus Word Clock Input/Output
H9	36	DVDD	Digital Core Voltage Supply, 1.65V – 1.95V
G8	37	MCLK	Master Clock Inputt
G9	38	BCLK	Audio Serial Data Bus Bit Clock (Input/Output)
F9	39	WCLK	Audio Serial Data Bus Word Clock (Input/Output)

A5	4	LINE1LM	MIC1 or Line1 Analog Input (Left Minus or Multifunction)
B7	5	LINE1RP	MIC1 or Line1 Analog Input (Right Plus or Multifunction)
B6	6	LINE1RM	MIC1 or Line1 Analog Input (Right Minus or Multifunction)
A4	7	LINE2LP	MIC2 or Line2 Analog Input (Left Plus or Multifunction)
B5	8	LINE2LM	MIC2 or Line2 Analog Input (Left Minus or Multifunction)
B4	9	LINE2RP	MIC2 or Line2 Analog Input (Right Plus or Multifunction)
A3	10	LINE2RM	MIC2 or Line2 Analog Input (Right Minus or Multifunction)
B3	11	MIC3L	MIC3 Input (Left or Multifunction)
B2	12	MICDET	Microphone Detect
C4-C7, D3-D7, E3-E7, F3-F7, G3-G7, H3-H7	–	NC	Do not connect.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)^{(1) (2)}

		VALUE	UNIT
	AVDD to AVSS, DRVDD to DRVSS	-0.3 to 3.9	V
	AVDD to DRVSS	-0.3 to 3.9	V
	IOVDD to DVSS	-0.3 to 3.9	V
	DVDD to DVSS	-0.3 to 2.5	V
	AVDD to DRVDD	-0.1 to 0.1	V
	Digital input voltage to DVSS	-0.3 V to IOVDD+0.3	V
	Analog input voltage to AVSS	-0.3 V to AVDD+0.3	V
	Operating temperature range	-40 to +85	°C
	Storage temperature range	-65 to +105	°C
T _J Max	Junction temperature	105	°C
	Power dissipation	$(T_J \text{ Max} - T_A) / \theta_{JA}$	
θ_{JA}	Thermal impedance, BGA package	63	°C/W
	Thermal impedance, QFN package	38.5	°C/W

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) ESD compliance tested to EIA / JESD22-A114-B and passed.

DISSIPATION RATINGS⁽¹⁾

PACKAGE TYPE	T _A = 25°C POWER RATING	DERATING FACTOR	T _A = 75°C POWER RATING	T _A = 85°C POWER RATING

Filter gain at 0.5 Fs			–17.5		dB
Filter gain from 0.55 Fs to 64 Fs			–75		dB
Filter group delay			17/Fs		Sec

- (1) Ratio of output level with 1-kHz full-scale sine wave input, to the output level with the inputs short circuited, measured A-weighted over a 20-Hz to 20-kHz bandwidth using an audio analyzer.
- (2) All performance measurements done with 20-kHz low-pass filter and, where noted, A-weighted filter. Failure to use such a filter may result in higher THD+N and lower SNR and dynamic range readings than shown in the Electrical Characteristics. The low-pass filter removes out-of-band noise, which, although not audible, may affect dynamic specification values.

ELECTRICAL CHARACTERISTICS (continued)

At 25°C, AVDD, DRVDD, IOVDD = 3.3 V, DVDD = 1.8 V, Fs = 48-kHz, 16-bit audio data (unless otherwise noted)

OVERVIEW

The TLV320AIC33 is a highly flexible, low power, stereo audio codec with extensive feature integration, intended for applications in smartphones, PDAs, and portable computing, communication, and entertainment applications. Available in a 5x5mm 80-ball BGA (with 51 balls actually used) and 7x7mm 48-lead QFN, the product integrates a host of features to reduce cost, board space, and power consumption in space-constrained, battery-powered, portable applications.

The TLV320AIC33 consists of the following blocks:

- Stereo audio multi-bit delta-sigma DAC (8 kHz – 96 kHz)
- Stereo audio multi-bit delta-sigma ADC (8 kHz – 96 kHz)
- Programmable digital audio effects processing (3-D, bass, treble, mid-range, EQ, de-emphasis)
- Six audio inputs
- Four high-power audio output drivers (headphone/speaker drive capability)
- Three fully differential line output drivers
- Fully programmable PLL
- Headphone/headset jack detection with interrupt

Communication to the TLV320AIC33 for control is pin-selectable (using the SELECT pin) as either SPI or I²C. The SPI interface requires that the Slave Select signal (MFP0) be driven low to communicate with the TLV320AIC33. Data is then shifted into or out of the TLV320AIC33 under control of the host microprocessor, which also provides the serial data clock. The I²C interface supports both standard and fast communication modes, and also enables cascading of up to four multiple codecs on the same I²C bus through the use of two pins for addressing (MFP0, MFP1).

HARDWARE RESET

The TLV320AIC33 requires a hardware reset after power-up for proper operation. After all power supplies are at their specified values, the RESET pin must be driven low for at least 10 ns. If this reset sequence is not performed, the 'AIC33 may not respond properly to register reads/writes.

DIGITAL CONTROL SERIAL INTERFACE

The TLV320AIC33 control interface supports SPI or I²C communication protocols, with the protocol selectable using the SELECT pin. For SPI, SELECT should be tied high; for I²C, SELECT should be tied low. It is not recommended to change the state of SELECT during device operation.

SPI CONTROL MODE

Figure 15. SPI Write

Figure 16. SPI Read

In the SPI control mode, the TLV320AIC33 uses the pins MFP0=SSB, MFP1=SCLK, MFP2=MISO, MFP3=MOSI as a standard SPI port with clock polarity setting of 0 (typical microprocessor SPI control bit CPOL = 0). The SPI port allows full-duplex, synchronous, serial communication between a host processor (the master) and peripheral devices (slaves). The SPI master (in this case, the host processor) generates the synchronizing clock (driven onto SCLK) and initiates transmissions. The SPI slave devices (such as the TLV320AIC33) depend on a master to start and synchronize transmissions.

A transmission begins when initiated by an SPI master. The byte from the SPI master begins shifting in on the slave MOSI pin under the control of the master serial clock (driven onto SCLK). As the byte shifts in on the MOSI pin, a byte shifts out on the MISO pin to the master shift register.

The TLV320AIC33 interface is designed so that with a clock phase bit setting of 1 (typical microprocessor SPI control bit CPHA = 1), the master begins driving its MOSI pin and the slave begins driving its MISO pin on the first serial clock edge. The SSB pin can remain low between transmissions; however, the TLV320AIC33 only interprets the first 8 bits transmitted after the falling edge of SSB as a command byte, and the next 8 bits as a data byte only if writing to a register. Reserved register bits should be written to their default values.

SPI COMMUNICATION PROTOCOL

The TLV320AIC33 is entirely controlled by registers. Reading and writing these registers is accomplished by the use of an 8-bit command, which is sent to the MOSI pin of the part prior to the data for that register. The command is constructed as shown in the Command Word table. The first 7 bits specify the register address which is being written or read, from 0 to 127 (decimal). The command word ends with an R/W bit, which specifies the direction of data flow on the serial bus. In the case of a register write, the R/W bit should be set to 0. A second byte of data is sent to the MOSI pin and contains the data to be written to the register.

Reading of registers is accomplished in similar fashion. The 8-bit command word sends the 7-bit register address, followed by R/W bit = 1 to signify a register read is occurring,. The 8-bit register data is then clocked out of the part on the MISO pin during the second 8 SCLK clocks in the frame.

Command Word

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
ADDR6	ADDR5	ADDR4	ADDR3	ADDR2	ADDR1	ADDR0	R/W

The register map of the TLV320AIC33 actually consists of multiple pages of registers, with each page containing 128 registers. The register at address zero on each page is used as a page-control register, and writing to this register determines the active page for the device. All subsequent read/write operations will access the page that is active at the time, unless a register write is performed to change the active page. Only two pages of registers are implemented in this product, with the active page defaulting to page 0 upon device reset.

For example, at device reset, the active page defaults to page 0, and thus all register read/write operations for addresses 1 to 127 will access registers in page 0. If registers on page 1 must be accessed, the user must write the 8-bit sequence 0x01 to register 0, the page control register, to change the active page from page 0 to page 1. After this write, it is recommended the user also read back the page control register, to safely ensure the change

in page control has occurred properly. Future read/write operations to addresses 1 to 127 will now access registers in page 1. When page 0 registers must be accessed again, the user writes the 8-bit sequence 0x00 to register 0, the page control register, to change the active page back to page 0. After a recommended read of the page control register, all further read/write operations to addresses 1 to 127 will now access page 0 registers again.

Limitation on Register Writing

When writing registers in SPI mode related to the audio output drivers mux, mix, gain configuration, etc., do not use the auto-increment mode. In addition, between two successive writes to these registers, the host should keep MFP0 (SPI chip select) high for at least 6.25us, to ensure that the register writes have occurred properly.

CONTINUOUS READ / WRITE OPERATION

The TLV320AIC33 includes the ability to read/write registers continuously, without needing to provide an address for every register accessed. In SPI mode, a continuous write is executed by transitioning MFP0 (SPI chip select) low to start the frame, sending the first 8-bit command word to read/write a particular register, and then sending multiple bytes of register data, intended for the addressed register and those following. A continuous read is done similarly, with multiple bytes read in from the addressed register and the following registers on the page. When the MFP0 (SPI chip select) pin is transitioned high again, the frame ends, as does the continuous read/write operation. A new frame must begin again with a new command word, to start the next bus transaction.

Note that this continuous read/write operation does not continue past a page boundary. The user should not attempt to read/write past the end of a page, since this may result in undesirable operation.

I²C CONTROL MODE

The TLV320AIC33 supports the I²C control protocol when the SELECT pin is tied low, using 7-bit addressing and capable of both standard and fast modes. TLV320AIC33 supports the I²C control protocol using 7-bit addressing and capable of both standard and fast modes. For I²C fast mode, note that the minimum timing for each of t_{HD-STA}, t_{SU-STA}, and t_{SU-STO} is 2.0 μs, as seen in [Figure 17](#). When in I²C control mode, the TLV320AIC33 can be configured for one of four different addresses, using the multifunction pins MFP0 and MFP1, which control the two LSBs of the device address. The 5 MSBs of the device address are fixed as 00110 and cannot be changed, while the two LSBs are given by MFP1:MFP0. This results in four possible device addresses:

I²C slave Device Addresses for MFP1, MFP0 Settings

MFP1	MFP0	Device Address
0	0	0011000
0	1	0011001
1	0	0011010
1	1	0011011

Figure 17. I²C Interface Timing

I²C is a two-wire, open-drain interface supporting multiple devices and masters on a single bus. Devices on the I²C bus only drive the bus lines LOW by connecting them to ground; they never drive the bus lines HIGH. Instead, the bus wires are pulled HIGH by pull-up resistors, so the bus wires are HIGH when no device is driving them LOW. This way, two devices cannot conflict; if two devices drive the bus simultaneously, there is no driver contention.

Communication on the I²C bus always takes place between two devices, one acting as the master and the other acting as the slave. Both masters and slaves can read and write, but slaves can only do so under the direction of the master. Some I²C devices can act as masters or slaves, but the TLV320AIC33 can only act as a slave device.

An I²C bus consists of two lines, SDA and SCL. SDA carries data; SCL provides the clock. All data is transmitted across the I²C bus in groups of eight bits. To send a bit on the I²C bus, the SDA line is driven to the appropriate level while SCL is LOW (a LOW on SDA indicates the bit is zero; a HIGH indicates the bit is one). Once the SDA line has settled, the SCL line is brought HIGH, then LOW. This pulse on SCL clocks the SDA bit into the receivers shift register.

The I²C bus is bidirectional: the SDA line is used both for transmitting and receiving data. When a master reads from a slave, the slave drives the data line; when a master sends to a slave, the master drives the data line. Under normal circumstances the master drives the clock line.

Most of the time the bus is idle, no communication is taking place, and both lines are HIGH. When communication is taking place, the bus is active. Only master devices can start a communication. They do this by causing a START condition on the bus. Normally, the data line is only allowed to change state while the clock line is LOW. If the data line changes state while the clock line is HIGH, it is either a START condition or its counterpart, a STOP condition. A START condition is when the clock line is HIGH and the data line goes from HIGH to LOW. A STOP condition is when the clock line is HIGH and the data line goes from LOW to HIGH.

After the master issues a START condition, it sends a byte that indicates which slave device it wants to communicate with. This byte is called the address byte. Each device on an I²C bus has a unique 7-bit address to which it responds. (Slaves can also have 10-bit addresses; see the I²C specification for details.) The master sends an address in the address byte, together with a bit that indicates whether it wishes to read from or write to the slave device.

Every byte transmitted on the I²C bus, whether it is address or data, is acknowledged with an acknowledge bit. When a master has finished sending a byte (eight data bits) to a slave, it stops driving SDA and waits for the slave to acknowledge the byte. The slave acknowledges the byte by pulling SDA LOW. The master then sends a clock pulse to clock the acknowledge bit. Similarly, when a master has finished reading a byte, it pulls SDA LOW to acknowledge this to the slave. It then sends a clock pulse to clock the bit.

A not-acknowledge is performed by simply leaving SDA HIGH during an acknowledge cycle. If a device is not present on the bus, and the master attempts to address it, it will receive a not-acknowledge because no device is present at that address to pull the line LOW.

When a master has finished communicating with a slave, it may issue a STOP condition. When a STOP condition is issued, the bus becomes idle again. A master may also issue another START condition. When a START condition is issued while the bus is active, it is called a repeated START condition.

The TLV320AIC33 also responds to and acknowledges a General Call, which consists of the master issuing a command with a slave address byte of 00H.

Figure 18. I²C Write

Figure 19. I²C Read

In the case of an I²C register write, if the master does not issue a STOP condition, then the device enters auto-increment mode. So in the next eight clocks, the data on SDA is treated as data for the next incremental register.

Similarly, in the case of an I²C register read, after the device has sent out the 8-bit data from the addressed register, if the master issues an ACKNOWLEDGE, the slave takes over control of SDA bus and transmit for the next 8 clocks the data of the next incremental register.

DIGITAL AUDIO DATA SERIAL INTERFACE

Audio data is transferred between the host processor and the TLV320AIC33 via the digital audio data serial interface, or *audio bus*. The audio bus on this device is very flexible, including left or right justified data options, support for I²S or PCM protocols, programmable data length options, a TDM mode for multichannel operation, very flexible master/slave configurability for each bus clock line, and the ability to communicate with multiple devices within a system directly.

The data serial interface uses two sets of pins for communication between external devices, with the particular pin used controlled through register programming. This configuration is shown in [Figure 20](#) below.

Figure 20. Alternate Audio Bus Multiplexing Function

In cases where MFP3 is needed for a secondary device digital input, the TLV320AIC33 must be used in I²C mode (when in SPI mode, MFP3 is used as the SPI bus MOSI pin and thus cannot be used here as an alternate digital input source).

This mux capability allows the TLV320AIC33 to communicate with two separate devices with independent I²S/PCM buses. An example of such an application is a cellphone containing a Bluetooth transceiver with PCM/I²S interface, as shown in Figure 21. The applications processor can be connected to the WCLK, BCLK, DIN, DOUT pins on the TLV320AIC33, while a Bluetooth device with PCM interface can be connected to the GPIO1, GPIO2, MFP3, and DOUT pins on the TLV320AIC33. By programming the registers via I²C control, the applications processor can determine which device is communicating with the TLV320AIC33. This is attractive in cases where the TLV320AIC33 can be configured to communicate data with the Bluetooth device, then the applications processor can be put into a low power sleep mode, while voice/audio transmission still occurs between the Bluetooth device and the TLV320AIC33.

Possible Processor Types:
Application Processor, Multimedia Processor,
Compressed Audio Decoder, Wireless Modem,
Bluetooth Module, Additional Audio/Voice Codec

Figure 21. AIC33 Connected to Multiple Audio Devices

The audio bus of the TLV320AIC33 can be configured for left or right justified, I²S, DSP, or TDM modes of operation, where communication with standard telephony PCM interfaces is supported within the TDM mode. These modes are all MSB-first, with data width programmable as 16, 20, 24, or 32 bits. In addition, the word clock (WCLK or GPIO1) and bit clock (BCLK or GPIO2) can be independently configured in either Master or Slave mode, for flexible connectivity to a wide variety of processors

The word clock (WCLK or GPIO1) is used to define the beginning of a frame, and may be programmed as either a pulse or a square-wave signal. The frequency of this clock corresponds to the maximum of the selected ADC and DAC sampling frequencies.

The bit clock (BCLK or GPIO2) is used to clock in and out the digital audio data across the serial bus. When in Master mode, this signal can be programmed in two further modes: continuous transfer mode, and 256-clock mode. In continuous transfer mode, only the minimal number of bit clocks needed to transfer the audio data are generated, so in general the number of bit clocks per frame will be two times the data width. For example, if data width is chosen as 16-bits, then 32 bit clocks will be generated per frame. If the bit clock signal in master mode will be used by a PLL in another device, it is recommended that the 16-bit or 32-bit data width selections be used. These cases result in a low jitter bit clock signal being generated, having frequencies of $32 \times F_s$ or $64 \times F_s$. In the cases of 20-bit and 24-bit data width in master mode, the bit clocks generated in each frame will not all be of equal period, due to the device not having a clean $40 \times F_s$ or $48 \times F_s$ clock signal readily available. The average frequency of the bit clock signal is still accurate in these cases (being $40 \times F_s$ or $48 \times F_s$), but the resulting clock signal has higher jitter than in the 16-bit and 32-bit cases.

In 256-clock mode, a constant 256 bit clocks per frame are generated, independent of the data width chosen. The TLV320AIC33 further includes programmability to tri-state the DOUT line during all bit clocks when valid data is not being sent. By combining this capability with the ability to program at what bit clock in a frame the audio data will begin, time-division multiplexing (TDM) can be accomplished, resulting in multiple codecs able to use a single audio serial data bus.

When the audio serial data bus is powered down while configured in master mode, the pins associated with the interface will be put into a tri-state output condition.

RIGHT JUSTIFIED MODE

In right-justified mode, the LSB of the left channel is valid on the rising edge of the bit clock preceding the falling edge of word clock. Similarly, the LSB of the right channel is valid on the rising edge of the bit clock preceding the rising edge of the word clock.

Figure 22. Right Justified Serial Bus Mode Operation

LEFT JUSTIFIED MODE

In left-justified mode, the MSB of the right channel is valid on the rising edge of the bit clock following the falling edge of the word clock. Similarly the MSB of the left channel is valid on the rising edge of the bit clock following the rising edge of the word clock.

Figure 23. Left Justified Serial Data Bus Mode Operation

I²S MODE

In I²S mode, the MSB of the left channel is valid on the second rising edge of the bit clock after the falling edge of the word clock. Similarly the MSB of the right channel is valid on the second rising edge of the bit clock after the rising edge of the word clock.

Figure 24. I²S Serial Data Bus Mode Operation

DSP MODE

In DSP mode, the rising edge of the word clock starts the data transfer with the left channel data first and immediately followed by the right channel data. Each data bit is valid on the falling edge of the bit clock.

T0152-01

Figure 25. DSP Serial Bus Mode Operation

TDM DATA TRANSFER

Time-division multiplexed data transfer can be realized in any of the above transfer modes if the 256-clock bit clock mode is selected, although it is recommended to be used in either left-justified mode or DSP mode. By changing the programmable offset, the bit clock in each frame where the data begins can be changed, and the serial data output driver (DOUT) can also be programmed to tri-state during all bit clocks except when valid data is being put onto the bus. This allows other codecs to be programmed with different offsets and to drive their data onto the same DOUT line, just in a different slot. For incoming data, the codec simply ignores data on the bus except where it is expected based on the programmed offset.

Note that the location of the data when an offset is programmed is different, depending on what transfer mode is selected. In DSP mode, both left and right channels of data are transferred immediately adjacent to each other in the frame. This differs from left-justified mode, where the left and right channel data will always be a half-frame apart in each frame. In this case, as the offset is programmed from zero to some higher value, both the left and right channel data move across the frame, but still stay a full half-frame apart from each other. This is depicted in [Figure 26](#) for the two cases.

Figure 26. DSP Mode and Left Justified Modes, Showing the Effect of a Programmed Data Word Offset

AUDIO DATA CONVERTERS

The TLV320AIC33 supports the following standard audio sampling rates: 8 kHz, 11.025 kHz, 12 kHz, 16 kHz, 22.05 kHz, 24 kHz, 32 kHz, 44.1 kHz, 48 kHz, 88.2 kHz, and 96 kHz. The converters can also operate at different sampling rates in various combinations, which are described further below.

The data converters are based on the concept of an F_{sref} rate that is used internal to the part, and it is related to the actual sampling rates of the converters through a series of ratios. For typical sampling rates, F_{sref} will be either 44.1 kHz or 48 kHz, although it can realistically be set over a wider range of rates up to 53 kHz, with additional restrictions applying if the PLL is used. This concept is used to set the sampling rates of the ADC and DAC, and also to enable high quality playback of low sampling rate data, without high frequency audible noise being generated.

The sampling rate of the ADC and DAC can be set to $F_{sref}/NDAC$ or $2 \times F_{sref}/NDAC$, with $NDAC$ being 1, 1.5, 2, 2.5, 3, 3.5, 4, 4.5, 5, 5.5, or 6.

While only one F_{sref} can be used at a time in the part, the ADC and DAC sampling rates can differ from each other by using different $NADC$ and $NDAC$ divider ratios for each. For example, with $F_{sref}=44.1$ -kHz, the DAC sampling rate can be set to 44.1-kHz by using $NDAC=1$, while the ADC sampling rate can be set to 8.018-kHz by using $NADC=5.5$.

When the ADCs and DACs are operating at different sampling rates, an additional word clock is required, to provide information regarding where data begins for the ADC versus the DAC. In this case, the standard bit clock signal (which can be supplied through the BCLK pin or through GPIO2) is used to transfer both ADC and DAC data, the standard word clock signal is used to identify the start of the DAC data, and a separate ADC word clock signal (denoted ADWK) is used. This clock can be supplied or generated from GPIO1 at the same time the DAC word clock is supplied or generated from WCLK.

AUDIO CLOCK GENERATION

The audio converters in the TLV320AIC33 need an internal audio master clock at a frequency of $256 \times F_{sref}$, which can be obtained in a variety of manners from an external clock signal applied to the device.

A more detailed diagram of the audio clock section of the TLV320AIC33 is shown in [Figure 27](#).

Figure 27. Audio Clock Generation Processing

The part can accept an MCLK input from 512 kHz to 50 MHz, which can then be passed through either a programmable divider or a PLL, to get the proper internal audio master clock needed by the part. The BCLK or GPIO2 inputs can also be used to generate the internal audio master clock.

This design also allows the PLL to be used for an entirely separate purpose in a system, if the audio codec is not powered up. The user can supply a separate clock to GPIO2, route this through the PLL, with the resulting output clock driven out GPIO1, for use by other devices in the system

A primary concern is proper operation of the codec at various sample rates with the limited MCLK frequencies available in the system. This device includes a highly programmable PLL to accommodate such situations easily. The integrated PLL can generate audio clocks from a wide variety of possible MCLK inputs, with particular focus paid to the standard MCLK rates already widely used.

When the PLL is disabled,

$$F_{sref} = CLKDIV_IN / (128 \times Q)$$

Where $Q = 2, 3, \dots, 17$

CLKDIV_IN can be MCLK, BCLK, or GPIO2, selected by register 102, bits D7-D6.

NOTE – when NDAC = 1.5, 2.5, 3.5, 4.5, or 5.5, odd values of Q are not allowed. In this mode, MCLK can be as high as 50 MHz, and Fsref should fall within 39 kHz to 53 kHz.

When the PLL is enabled,

$$F_{sref} = (PLLCLK_IN \times K \times R) / (2048 \times P), \text{ where}$$

$$P = 1, 2, 3, \dots, 8$$

$$R = 1, 2, \dots, 16$$

$$K = J.D$$

$$J = 1, 2, 3, \dots, 63$$

$$D = 0000, 0001, 0002, 0003, \dots, 9998, 9999$$

PLLCLK_IN can be MCLK or BCLK, selected by Page 0, register 102, bits D5-D4

P, R, J, and D are register programmable. J is the integer portion of K (the numbers to the left of the decimal point), while D is the fractional portion of K (the numbers to the right of the decimal point, assuming four digits of precision).

Examples:

If $K = 8.5$, then $J = 8$, $D = 5000$

If $K = 7.12$, then $J = 7$, $D = 1200$

If $K = 14.03$, then $J = 14$, $D = 0300$

If $K = 6.0004$, then $J = 6$, $D = 0004$

When the PLL is enabled and $D = 0000$, the following conditions must be satisfied to meet specified performance:

$$2 \text{ MHz} \leq (PLLCLK_IN / P) \leq 20 \text{ MHz}$$

$$80 \text{ MHz} \leq (PLLCLK_IN \times K \times R / P) \leq 110 \text{ MHz}$$

$$4 \leq J \leq 55$$

When the PLL is enabled and $D \neq 0000$, the following conditions must be satisfied to meet specified performance:

$$10 \text{ MHz} \leq PLLCLK_IN / P \leq 20 \text{ MHz}$$

$$80 \text{ MHz} \leq PLLCLK_IN \times K \times R / P \leq 110 \text{ MHz}$$

$$4 \leq J \leq 11$$

$$R = 1$$

Example:

MCLK = 12 MHz and $F_{sref} = 44.1 \text{ kHz}$

Select $P = 1$, $R = 1$, $K = 7.5264$, which results in $J = 7$, $D = 5264$

Example:

MCLK = 12 MHz and $F_{sref} = 48.0 \text{ kHz}$

Select $P = 1$, $R = 1$, $K = 8.192$, which results in $J = 8$, $D = 1920$

The table below lists several example cases of typical MCLK rates and how to program the PLL to achieve $F_{sref} = 44.1$ kHz or 48 kHz.

F_{sref} = 44.1 kHz						
MCLK (MHz)	P	R	J	D	ACHIEVED FSREF	% ERROR
2.8224	1	1	32	0	44100.00	0.0000
5.6448	1	1	16	0	44100.00	0.0000
12.0	1	1	7	5264	44100.00	0.0000
13.0	1	1	6	9474	44099.71	0.0007
16.0	1	1	5	6448	44100.00	0.0000
19.2	1	1	4	7040	44100.00	0.0000
19.68	1	1	4	5893	44100.30	-0.0007
48.0	4	1	7	5264	44100.00	0.0000
F_{sref} = 48 kHz						
MCLK (MHz)	P	R	J	D	ACHIEVED FSREF	% ERROR
2.048	1	1	48	0	48000.00	0.0000
3.072	1	1	32	0	48000.00	0.0000
4.096	1	1	24	0	48000.00	0.0000
6.144	1	1	16	0	48000.00	0.0000
8.192	1	1	12	0	48000.00	0.0000
12.0	1	1	8	1920	48000.00	0.0000
13.0	1	1	7	5618	47999.71	0.0006
16.0	1	1	6	1440	48000.00	0.0000
19.2	1	1	5	1200	48000.00	0.0000
19.68	1	1	4	9951	47999.79	0.0004
48.0	4	1	8	1920	48000.00	0.0000

The AIC33 can also output a separate clock on the GPIO1 pin. If the PLL is being used for the audio data converter clock, the M and N settings can be used to provide a divided version of the PLL output. If the PLL is not being used for the audio data converter clock, the PLL can still be enabled to provide a completely independent clock output on GPIO1. The formula for the GPIO1 clock output when PLL is enabled and CLKMUX_OUT is 0 is:

$$\text{GPIO1} = (\text{PLLCLK_IN} \times 2 \times K \times R) / (M \times N \times P)$$

When CLKMUX_OUT is 1, regardless of whether PLL is enabled or disabled, the input to the clock output divider can be selected as MCLK, BCLK, or GPIO2. In this case, the formula for the GPIO1 clock is:

$$\text{GPIO1} = (\text{CLKDIV_IN} \times 2) / (M \times N), \text{ where}$$

$$M = 1, 2, 4, 8$$

$$N = 2, 3, \dots, 17$$

CLKDIV_IN can be BCLK, MCLK, or GPIO2, selected by page 0, register 102, bits D7-D6

STEREO AUDIO ADC

The TLV320AIC33 includes a stereo audio ADC, which uses a delta-sigma modulator with 128-times oversampling in single-rate mode, followed by a digital decimation filter. The ADC supports sampling rates from 8 kHz to 48 kHz in single-rate mode, and up to 96 kHz in dual-rate mode. Whenever the ADC or DAC is in operation, the device requires an audio master clock be provided and appropriate audio clock generation be setup within the part.

In order to provide optimal system power dissipation, the stereo ADC can be powered one channel at a time, to support the case where only mono record capability is required. In addition, both channels can be fully powered or entirely powered down.

The integrated digital decimation filter removes high-frequency content and downsamples the audio data from an initial sampling rate of $128 F_s$ to the final output sampling rate of F_s . The decimation filter provides a linear phase output response with a group delay of $17/F_s$. The -3 dB bandwidth of the decimation filter extends to $0.45 F_s$ and scales with the sample rate (F_s). The filter has minimum 75dB attenuation over the stopband from $0.55 F_s$ to $64 F_s$. Independent digital highpass filters are also included with each ADC channel, with a corner frequency that can be independently set to three different settings or can be disabled entirely.

Because of the oversampling nature of the audio ADC and the integrated digital decimation filtering, requirements for analog anti-aliasing filtering are very relaxed. The TLV320AIC33 integrates a second order analog anti-aliasing filter with 20-dB attenuation at 1 MHz. This filter, combined with the digital decimation filter, provides sufficient anti-aliasing filtering without requiring additional external components.

The ADC is preceded by a programmable gain amplifier (PGA), which allows analog gain control from 0 dB to 59.5 dB in steps of 0.5 dB. The PGA gain changes are implemented with an internal soft-stepping algorithm that only changes the actual volume level by one 0.5-dB step every one or two ADC output samples, depending on the register programming (see registers Page-0/Reg-19 and 22). This soft-stepping ensures that volume control changes occur smoothly with no audible artifacts. On reset, the PGA gain defaults to a mute condition, and upon power down, the PGA soft-steps the volume to mute before shutting down. A read-only flag is set whenever the gain applied by PGA equals the desired value set by the register. The soft-stepping control can also be disabled by programming a register bit. When soft stepping is enabled, the audio master clock must be applied to the part after the ADC power down register is written to ensure the soft-stepping to mute has completed. When the ADC powerdown flag is no longer set, the audio master clock can be shut down.

AUTOMATIC GAIN CONTROL (AGC)

An automatic gain control (AGC) circuit is included with the ADC and can be used to maintain nominally constant output signal amplitude when recording speech signals (it can be fully disabled if not desired). This circuitry automatically adjusts the PGA gain as the input signal becomes overly loud or very weak, such as when a person speaking into a microphone moves closer or farther from the microphone. The AGC algorithm has several programmable settings, including target gain, attack and decay time constants, noise threshold, and maximum PGA gain applicable that allow the algorithm to be fine tuned for any particular application. The algorithm uses the absolute average of the signal (which is the average of the absolute value of the signal) as a measure of the nominal amplitude of the output signal.

Note that completely independent AGC circuitry is included with each ADC channel with entirely independent control over the algorithm from one channel to the next. This is attractive in cases where two microphones are used in a system, but may have different placement in the end equipment and require different dynamic performance for optimal system operation.

Target gain represents the nominal output level at which the AGC attempts to hold the ADC output signal level. The TLV320AIC33 allows programming of eight different target gains, which can be programmed from -5.5 dB to -24 dB relative to a full-scale signal. Since the device reacts to the signal absolute average and not to peak levels, it is recommended that the larger gain be set with enough margin to avoid clipping at the occurrence of loud sounds.

Attack time determines how quickly the AGC circuitry reduces the PGA gain when the input signal is too loud. It can be varied from 8 ms to 20 ms.

Decay time determines how quickly the PGA gain is increased when the input signal is too low. It can be varied in the range from 100 ms to 500 ms.

Noise gate threshold determines the level below which if the input speech average value falls, AGC considers it as a silence and hence brings down the gain to 0 dB in steps of 0.5 dB every FS and sets the noise threshold flag. The gain stays at 0 dB unless the input speech signal average rises above the noise threshold setting. This ensures that noise does not get gained up in the absence of speech. Noise threshold level in the AGC algorithm is programmable from -30 dB to -90 dB relative to full scale. A disable noise gate feature is also available. This operation includes programmable debounce and hysteresis functionality to avoid the AGC gain from cycling between high gain and 0 dB when signals are near the noise threshold level. When the noise threshold flag is set, the status of gain applied by the AGC and the saturation flag should be ignored.

Maximum PGA gain applicable allows the user to restrict the maximum PGA gain that can be applied by the AGC algorithm. This can be used for limiting PGA gain in situations where environmental noise is greater than programmed noise threshold. It can be programmed from 0 dB to $+59.5$ dB in steps of 0.5 dB.

Figure 28. Typical Operation of the AGC Algorithm During Speech Recording

Note that the time constants here are correct when the ADC is not in double-rate audio mode. The time constants are achieved using the F_{sref} value programmed in the control registers. However, if the F_{sref} is set in the registers to, for example, 48 kHz, but the actual audio clock or PLL programming actually results in a different F_{sref} in practice, then the time constants would not be correct.

STEREO AUDIO DAC

The TLV320AIC33 includes a stereo audio DAC supporting sampling rates from 8 kHz to 96 kHz. Each channel of the stereo audio DAC consists of a digital audio processing block, a digital interpolation filter, multi-bit digital delta-sigma modulator, and an analog reconstruction filter. The DAC is designed to provide enhanced performance at low sampling rates through increased oversampling and image filtering, thereby keeping quantization noise generated within the delta-sigma modulator and signal images strongly suppressed within the audio band to beyond 20 kHz. This is realized by keeping the upsampled rate constant at $128 \times F_{sref}$ and changing the oversampling ratio as the input sample rate is changed. For an F_{sref} of 48 kHz, the digital delta-sigma modulator always operates at a rate of 6.144 MHz. This ensures that quantization noise generated within the delta-sigma modulator stays low within the frequency band below 20 kHz at all sample rates. Similarly, for an F_{sref} rate of 44.1 kHz, the digital delta-sigma modulator always operates at a rate of 5.6448 MHz.

The following restrictions apply in the case when the PLL is powered down and double-rate audio mode is enabled in the DAC.

Allowed Q values = 4, 8, 9, 12, 16

Q values where equivalent F_{sref} can be achieved by turning on PLL

Q = 5, 6, 7 (set P = 5 / 6 / 7 and K = 16.0 and PLL enabled)

Q = 10, 14 (set P = 5, 7 and K = 8.0 and PLL enabled)

DIGITAL AUDIO PROCESSING

The DAC channel consists of optional filters for de-emphasis and bass, treble, midrange level adjustment, speaker equalization, and 3-D effects processing. The de-emphasis function is implemented by a programmable digital filter block with fully programmable coefficients (see Page-1/Reg-21-26 for left channel, Page-1/Reg-47-52 for right channel). If de-emphasis is not required in a particular application, this programmable filter block can be used for some other purpose. The de-emphasis filter transfer function is given by:

$$H(z) = \frac{N0 + N1 \times z^{-1}}{32768 - D1 \times z^{-1}} \tag{1}$$

where the N0, N1, and D1 coefficients are fully programmable individually for each channel. The coefficients that should be loaded to implement standard de-emphasis filters are given in [Table 1](#).

Table 1. De-Emphasis Coefficients for Common Audio Sampling Rates

SAMPLING FREQUENCY	N0	N1	D1
32-kHz	16950	-1220	17037
44.1-kHz	15091	-2877	20555
48-kHz ⁽¹⁾	14677	-3283	21374

(1) Default de-emphasis coefficients.

In addition to the de-emphasis filter block, the DAC digital effects processing includes a fourth order digital IIR filter with programmable coefficients (one set per channel). This filter is implemented as cascade of two biquad sections with frequency response given by:

$$\left(\frac{N0 + 2 \times N1 \times z^{-1} + N2 \times z^{-2}}{32768 - 2 \times D1 \times z^{-1} - D2 \times z^{-2}} \right) \left(\frac{N3 + 2 \times N4 \times z^{-1} + N5 \times z^{-2}}{32768 - 2 \times D4 \times z^{-1} - D5 \times z^{-2}} \right) \tag{2}$$

The N and D coefficients are fully programmable, and the entire filter can be enabled or bypassed. The structure of the filtering when configured for independent channel processing is shown below in [Figure 29](#), with LB1 corresponding to the first left-channel biquad filter using coefficients N0, N1, N2, D1, and D2. LB2 similarly corresponds to the second left-channel biquad filter using coefficients N3, N4, N5, D4, and D5. The RB1 and RB2 filters refer to the first and second right-channel biquad filters, respectively.

Figure 29. Structure of the Digital Effects Processing for Independent Channel Processing

The coefficients for this filter implement a variety of sound effects, with bass-boost or treble boost being the most commonly used in portable audio applications. The default N and D coefficients in the part are given in [Table 2](#) and implement a shelving filter with 0-dB gain from DC to approximately 150 Hz, at which point it rolls off to a 3-dB attenuation for higher frequency signals, thus giving a 3-dB boost to signals below 150 Hz. The N and D coefficients are represented by 16-bit two’s complement numbers with values ranging from –32768 to 32767.

Table 2. Default Digital Effects Processing Filter Coefficients, When in Independent Channel Processing Configuration

Coefficients				
N0 = N3	N1 = N4	N2 = N5	D1 = D4	D2 = D5
27619	-27034	26461	32131	-31506

The digital processing also includes capability to implement 3-D processing algorithms by providing means to process the mono mix of the stereo input, and then combine this with the individual channel signals for stereo output playback. The architecture of this processing mode, and the programmable filters available for use in the system, is shown in [Figure 30](#). Note that the programmable attenuation block provides a method of adjusting the level of 3-D effect introduced into the final stereo output. This combined with the fully programmable biquad filters in the system enables the user to fully optimize the audio effects for a particular system and provide extensive differentiation from other systems using the same device.

Figure 30. Architecture of the Digital Audio Processing When 3-D Effects are Enabled

It is recommended that the digital effects filters should be disabled while the filter coefficients are being modified. While new coefficients are being written to the device over the control port, it is possible that a filter using partially updated coefficients may actually implement an unstable system and lead to oscillation or objectionable audio output. By disabling the filters, changing the coefficients, and then re-enabling the filters, these types of effects can be entirely avoided.

DIGITAL INTERPOLATION FILTER

The digital interpolation filter upsamples the output of the digital audio processing block by the required oversampling ratio before data is provided to the digital delta-sigma modulator and analog reconstruction filter stages. The filter provides a linear phase output with a group delay of 21/Fs. In addition, programmable digital interpolation filtering is included to provide enhanced image filtering and reduce signal images caused by the upsampling process that are below 20 kHz. For example, upsampling an 8-kHz signal produces signal images at multiples of 8-kHz (i.e., 8 kHz, 16 kHz, 24 kHz, etc.). The images at 8 kHz and 16 kHz are below 20 kHz and still audible to the listener; therefore, they must be filtered heavily to maintain a good quality output. The interpolation

filter is designed to maintain at least 65-dB rejection of images that land below 7.455 Fs. In order to utilize the programmable interpolation capability, the Fsref should be programmed to a higher rate (restricted to be in the range of 39 kHz to 53 kHz when the PLL is in use), and the actual Fs is set using the NDAC divider. For example, if Fs = 8 kHz is required, then Fsref can be set to 48 kHz, and the DAC Fs set to Fsref/6. This ensures that all images of the 8-kHz data are sufficiently attenuated well beyond a 20-kHz audible frequency range.

DELTA-SIGMA AUDIO DAC

The stereo audio DAC incorporates a third order multi-bit delta-sigma modulator followed by an analog reconstruction filter. The DAC provides high-resolution, low-noise performance, using oversampling and noise shaping techniques. The analog reconstruction filter design consists of a 6-tap analog FIR filter followed by a continuous time RC filter. The analog FIR operates at a rate of $128 \times \text{Fsref}$ (6.144 MHz when Fsref = 48 kHz, 5.6448 MHz when Fsref = 44.1 kHz). Note that the DAC analog performance may be degraded by excessive clock jitter on the MCLK input. Therefore, care must be taken to keep jitter on this clock to a minimum.

AUDIO DAC DIGITAL VOLUME CONTROL

The audio DAC includes a digital volume control block which implements a programmable digital gain. The volume level can be varied from 0 dB to -63.5 dB in 0.5-dB steps, in addition to a mute bit, independently for each channel. The volume level of both channels can also be changed simultaneously by the master volume control. Gain changes are implemented with a soft-stepping algorithm, which only changes the actual volume by one step per input sample, either up or down, until the desired volume is reached. The rate of soft-stepping can be slowed to one step per two input samples through a register bit.

Because of soft-stepping, the host does not know when the DAC has been actually muted. This may be important if the host wishes to mute the DAC before making a significant change, such as changing sample rates. In order to help with this situation, the device provides a flag back to the host via a read-only register bit that alerts the host when the part has completed the soft-stepping and the actual volume has reached the desired volume level. The soft-stepping feature can be disabled through register programming. If soft-stepping is enabled, the MCLK signal should be kept applied to the device until the DAC power-down flag is set. When this flag is set, the internal soft-stepping process and power down sequence is complete, and the MCLK can then be stopped if desired.

The TLV320AIC33 also includes functionality to detect when the user switches on or off the de-emphasis or digital audio processing functions, to first (1) soft-mute the DAC volume control, (2) change the operation of the digital effects processing, and (3) soft-unmute the part. This avoids any possible pop/clicks in the audio output due to instantaneous changes in the filtering. A similar algorithm is used when first powering up or down the DAC. The circuit begins operation at power up with the volume control muted, then soft-steps it up to the desired volume level. At power down, the logic first soft-steps the volume down to a mute level, then powers down the circuitry.

ANALOG OUTPUT COMMON-MODE ADJUSTMENT

The output common-mode voltage and output range of the analog output are determined by an internal bandgap reference, in contrast to other codecs that may use a divided version of the supply. This scheme is used to reduce the coupling of noise that may be on the supply (such as 217-Hz noise in a GSM cellphone) into the audio signal path.

However, due to the possible wide variation in analog supply range (2.7 V – 3.6 V), an output common-mode voltage setting of 1.35 V, which would be used for a 2.7 V supply case, will be overly conservative if the supply is actually much larger, such as 3.3 V or 3.6 V. In order to optimize device operation, the TLV320AIC33 includes a programmable output common-mode level, which can be set by register programming to a level most appropriate to the actual supply range used by a particular customer. The output common-mode level can be varied among four different values, ranging from 1.35 V (most appropriate for low supply ranges, near 2.7 V) to 1.8 V (most appropriate for high supply ranges, near 3.6 V). Note that there is also some limitation on the range of DVDD voltage as well in determining which setting is most appropriate.

Table 3. Appropriate Settings

CM SETTING	RECOMMENDED AVDD, DRVDD	RECOMMENDED DVDD
1.35	2.7 V – 3.6 V	1.65 V – 1.95 V
1.50	3.0 V – 3.6 V	1.65 V – 1.95 V

Table 3. Appropriate Settings (continued)

CM SETTING	RECOMMENDED AVDD, DRVDD	RECOMMENDED DVDD
1.65 V	3.3 V – 3.6 V	1.8 V – 1.95 V
1.8 V	3.6 V	1.95 V

AUDIO DAC POWER CONTROL

The stereo DAC can be fully powered up or down, and in addition, the analog circuitry in each DAC channel can be powered up or down independently. This provides power savings when only a mono playback stream is needed.

AUDIO ANALOG INPUTS

The TLV320AIC33 includes ten analog audio input pins, which can be configured as up to four fully-differential pair plus one single-ended pair of audio inputs, or up to six single-ended audio inputs. . These pins connect through series resistors and switches to the virtual ground terminals of two fully differential opamps (one per ADC/PGA channel). By selecting to turn on only one set of switches per opamp at a time, the inputs can be effectively muxed to each ADC PGA channel.

By selecting to turn on multiple sets of switches per opamp at a time, mixing can also be achieved. Mixing of multiple inputs can easily lead to PGA outputs that exceed the range of the internal opamps, resulting in saturation and clipping of the mixed output signal. Whenever mixing is being implemented, the user should take adequate precautions to avoid such a saturation case from occurring. In general, the mixed signal should not exceed 2 V_{pp} (single-ended) or 4 V_{pp} (differential).

In most mixing applications, there is also a general need to adjust the levels of the individual signals being mixed. For example, if a soft signal and a large signal are to be mixed and played together, the soft signal generally should be amplified to a level comparable to the large signal before mixing. In order to accommodate this need, the TLV320AIC33 includes input level control on each of the individual inputs before they are mixed or muxed into the ADC PGAs, with gain programmable from 0 dB to –12 dB in 1.5 dB steps. Note that this input level control is not intended to be a volume control, but instead used occasionally for level setting. Soft-stepping of the input level control settings is implemented in this device, with the speed and functionality following the settings used by the ADC PGA for soft-stepping.

The TLV320AIC33 supports the ability to mix up to three fully-differential analog inputs into each ADC PGA channel. [Figure 31](#) shows the mixing configuration for the left channel, which can mix the signals LINE1LP-LINE1LM, LINE2LP-LINE2LM, and LINE1RP-LINE1RM

Figure 31. Left Channel Fully-Differential Analog Input Mixing Configuration

Three fully-differential analog inputs can similarly be mixed into the right ADC PGA as well, consisting of LINE1RP-LINE1RM, LINE2RP-LINE2RM, and LINE1LP-LINE1LM. Note that it is not necessary to mix all three fully-differential signals if this is not desired – unnecessary inputs can simply be muted using the input level control registers.

Inputs can also be selected as single-ended instead of fully-differential, and mixing or muxing into the ADC PGAs is also possible in this mode. It is not possible, however, for an input pair to be selected as fully-differential for connection to one ADC PGA and simultaneously selected as single-ended for connection to the other ADC PGA channel. However, it is possible for an input to be selected or mixed into both left and right channel PGAs, as long as it has the same configuration for both channels (either both single-ended or both fully-differential).

Figure 32 shows the single-ended mixing configuration for the left channel ADC PGA, which enables mixing of the signals LINE1LP, LINE2LP, LINE1RP, MIC3L, and MIC3R. The right channel ADC PGA mix is similar, enabling mixing of the signals LINE1RP, LINE2RP, LINE1LP, MIC3L, and MIC3R.

Figure 32. Left Channel Single-Ended Analog Input Mixing Configuration

ANALOG INPUT BYPASS PATH FUNCTIONALITY

The TLV320AIC33 includes the additional ability to route some analog input signals past the integrated data converters, for mixing with other analog signals and then direction connection to the output drivers. This capability is useful in a cellphone, for example, when a separate FM radio device provides a stereo analog output signal that needs to be routed to headphones. The TLV320AIC33 supports this in a low power mode by providing a direct analog path through the device to the output drivers, while all ADCs and DACs can be completely powered down to save power.

For fully-differential inputs, the TLV320AIC33 provides the ability to pass the signals LINE2LP-LINE2LM and LINE2RP-LINE2RM to the output stage directly. If in single-ended configuration, the device can pass the signal LINE2LP and LINE2RP to the output stage directly.

ADC PGA SIGNAL BYPASS PATH FUNCTIONALITY

In addition to the input bypass path described above, the TLV320AIC33 also includes the ability to route the ADC PGA output signals past the ADC, for mixing with other analog signals and then direction connection to the output drivers. These bypass functions are described in more detail in the sections on output mixing and output driver configurations.

INPUT IMPEDANCE AND VCM CONTROL

The TLV320AIC33 includes several programmable settings to control analog input pins, particularly when they are not selected for connection to an ADC PGA. The default option allows unselected inputs to be put into a tri-state condition, such that the input impedance seen looking into the device is extremely high. Note, however, that the pins on the device do include protection diode circuits connected to AVDD and AVSS. Thus, if any voltage is driven onto a pin approximately one diode drop (~0.6 V) above AVDD or one diode drop below AVSS, these protection diodes will begin conducting current, resulting in an effective impedance that no longer appears as a tri-state condition.

Another programmable option for unselected analog inputs is to weakly hold them at the common-mode input voltage of the ADC PGA (which is determined by an internal bandgap voltage reference). This is useful to keep the ac-coupling capacitors connected to analog inputs biased up at a normal DC level, thus avoiding the need for them to charge up suddenly when the input is changed from being unselected to selected for connection to an ADC PGA. This option is controlled in Page-0/Reg-20 and 23. The user should ensure this option is disabled when an input is selected for connection to an ADC PGA or selected for the analog input bypass path, since it can corrupt the recorded input signal if left operational when an input is selected.

In most cases, the analog input pins on the TLV320AIC33 should be ac-coupled to analog input sources, the only exception to this generally being if an ADC is being used for DC voltage measurement. The ac-coupling capacitor will cause a highpass filter pole to be inserted into the analog signal path, so the size of the capacitor must be chosen to move that filter pole sufficiently low in frequency to cause minimal effect on the processed analog signal. The input impedance of the analog inputs when selected for connection to an ADC PGA varies with the setting of the input level control, starting at approximately 20 k Ω with an input level control setting of 0-dB, and increasing to approximately 80-k Ω when the input level control is set at -12 dB. For example, using a 0.1 μ F ac-coupling capacitor at an analog input will result in a highpass filter pole of 80 Hz when the 0 dB input level control setting is selected.

MICBIAS GENERATION

The TLV320AIC33 includes a programmable microphone bias output voltage (MICBIAS), capable of providing output voltages of 2.0 V or 2.5 V (both derived from the on-chip bandgap voltage) with 4-mA output current drive. In addition, the MICBIAS may be programmed to be switched to AVDD directly through an on-chip switch, or it can be powered down completely when not needed, for power savings. This function is controlled by register programming in Page-0/Reg-25.

DIGITAL MICROPHONE CONNECTIVITY

The TLV320AIC33 includes support for connection of a digital microphone to the device by routing the digital signal directly into the ADC digital decimation filter, where it is filtered, downsampled, and provided to the host processor over the audio data serial bus.

When digital microphone mode is enabled, the TLV320AIC33 provides an oversampling clock output for use by the digital microphone to transmit its data. The TLV320AIC33 includes the capability to latch the data on either the rising, falling, or both edges of this supplied clock, enabling support for stereo digital microphones.

In this mode, the oversampling ratio of the digital mic modulator can be programmed as 128, 64 or 32 times the ADC sample rate, ADCFS. The GPIO1 pin will output the serial oversampling clock at the programmed rate. TLV320AIC33 latches the data input on GPIO2 as the Left and Right channel digital microphone data. For the Left channel input, GPIO2 will be sampled on the rising edge of the clock, and for the Right channel input, GPIO2 will be sampled on the falling edge of the clock. If a single digital mic channel is needed then the corresponding ADC channel should be powered up, and the unused channel should be powered down. When digital microphone mode is enabled, neither ADC can be used for digitizing analog inputs.

ANALOG FULLY DIFFERENTIAL LINE OUTPUT DRIVERS

The TLV320AIC33 has two fully differential line output drivers, each capable of driving a 10-kΩ differential load. The output stage design leading to the fully differential line output drivers is shown in Figure 33 and Figure 34. This design includes extensive capability to adjust signal levels independently before any mixing occurs, beyond that already provided by the PGA gain and the DAC digital volume control.

The LINE2L/R signals refer to the signals that travel through the analog input bypass path to the output stage. The PGA_L/R signals refer to the outputs of the ADC PGA stages that are similarly passed around the ADC to the output stage. Note that since both left and right channel signals are routed to all output drivers, a mono mix of any of the stereo signals can easily be obtained by setting the volume controls of both left and right channel signals to –6 dB and mixing them. Undesired signals can also be disconnected from the mix as well through register control.

Figure 33. Architecture of the Output Stage Leading to the Fully Differential Line Output Drivers

Figure 34. Detail of the Volume Control and Mixing Function Shown in Figure 29 and Figure 18

The DAC_L/R signals are the outputs of the stereo audio DAC, which can be steered by register control based on the requirements of the system. If mixing of the DAC audio with other signals is not required, and the DAC output is only needed at the stereo line outputs, then it is recommended to use the routing through path DAC_L3/R3 to the fully differential stereo line outputs. This results not only in higher quality output performance, but also in lower power operation, since the analog volume controls and mixing blocks ahead of these drivers can be powered down.

If instead the DAC analog output must be routed to multiple output drivers simultaneously (such as to LEFT_LOP/M, RIGHT_LOP/M, and MONO_LOP/M) or must be mixed with other analog signals, then the DAC outputs should be switched through the DAC_L1/R1 path. This option provides the maximum flexibility for routing of the DAC analog signals to the output drivers.

The TLV320AIC33 includes an output level control on each output driver with limited gain adjustment from 0 dB to 9 dB. The output driver circuitry in this device are designed to provide a low distortion output while playing fullscale stereo DAC signals at a 0dB gain setting. However, a higher amplitude output can be obtained at the cost of increased signal distortion at the output. This output level control allows the user to make this tradeoff based on the requirements of the end equipment. Note that this output level control is not intended to be used as a standard output volume control. It is expected to be used only sparingly for level setting, i.e., adjustment of the fullscale output range of the device.

Each differential line output driver can be powered down independently of the others when it is not needed in the system. When placed into powerdown through register programming, the driver output pins will be placed into a tri-stated, high-impedance state.

ANALOG HIGH POWER OUTPUT DRIVERS

The TLV320AIC33 includes four high power output drivers with extensive flexibility in their usage. These output drivers are individually capable of driving 30 mW each into a 16-Ω load in single-ended configuration, and they can be used in pairs to drive up to 500 mW into an 8-Ω load connected in bridge-terminated load (BTL) configuration between two driver outputs.

The high power output drivers can be configured in a variety of ways, including:

1. driving up to two fully differential output signals
2. driving up to four single-ended output signals
3. driving two single-ended output signals, with one or two of the remaining drivers driving a fixed VCM level, for a pseudo-differential stereo output
4. driving one or two 8-Ω speakers connected BTL between pairs of driver output pins

- driving stereo headphones in single-ended configuration with two drivers, while the remaining two drivers are connected in BTL configuration to an 8-Ω speaker.

The output stage architecture leading to the high power output drivers is shown in Figure 35, with the volume control and mixing blocks being effectively identical to that shown in Figure 34. Note that each of these drivers have a output level control block like those included with the line output drivers, allowing gain adjustment up to +9dB on the output signal. As in the previous case, this output level adjustment is not intended to be used as a standard volume control, but instead is included for additional fullscale output signal level control.

Two of the output drivers, HPROUT and HPLOUT, include a direct connection path for the stereo DAC outputs to be passed directly to the output drivers and bypass the analog volume controls and mixing networks, using the DAC_L2/R2 path. As in the line output case, this functionality provides the highest quality DAC playback performance with reduced power dissipation, but can only be utilized if the DAC output does not need to route to multiple output drivers simultaneously, and if mixing of the DAC output with other analog signals is not needed. This direction connection path will attenuate the signal by a factor of 1dB.

Figure 35. Architecture of the output stage leading to the high power output drivers

The high power output drivers include additional circuitry to avoid artifacts on the audio output during power-on and power-off transient conditions. The user should first program the type of output configuration being used in Page-0/Reg-14, to allow the device to select the optimal power-up scheme to avoid output artifacts. The power-up delay time for the high power output drivers is also programmable over a wide range of time delays, from instantaneous up to 4-sec, using Page-0/Reg-42.

When these output drivers are powered down, they can be placed into a variety of output conditions based on register programming. If lowest power operation is desired, then the outputs can be placed into a tri-state condition, and all power to the output stage is removed. However, this generally results in the output nodes drifting to rest near the upper or lower analog supply, due to small leakage currents at the pins. This then results in a longer delay requirement to avoid output artifacts during driver power-on. In order to reduce this required power-on delay, the TLV320AIC33 includes an option for the output pins of the drivers to be weakly driven to the VCM level they would normally rest at when powered with no signal applied. This output VCM level is determined by an internal bandgap voltage reference, and thus results in extra power dissipation when the drivers are in powerdown. However, this option provides the fastest method for transitioning the drivers from powerdown to full power operation without any output artifact introduced.

The device includes a further option that falls between the other two – while it requires less power drawn while the output drivers are in powerdown, it also takes a slightly longer delay to power-up without artifact than if the bandgap reference is kept alive. In this alternate mode, the powered-down output driver pin is weakly driven to a voltage of approximately half the DRVDD1/2 supply level using an internal voltage divider. This voltage will not match the actual VCM of a fully powered driver, but due to the output voltage being close to its final value, a much shorter power-up delay time setting can be used and still avoid any audible output artifacts. These output voltage options are controlled in Page-0/Reg-42.

The high power output drivers can also be programmed to power up first with the output level control in a highly attenuated state, then the output driver will automatically slowly reduce the output attenuation to reach the desired output level setting programmed. This capability is enabled by default but can be enabled in Page-0/Reg-40.

SHORT CIRCUIT OUTPUT PROTECTION

The TLV320AIC33 includes programmable short-circuit protection for the high power output drivers, for maximum flexibility in a given application. By default, if these output drivers are shorted, they will automatically limit the maximum amount of current that can be sourced to or sunk from a load, thereby protecting the device from an over-current condition. In this mode, the user can read Page-0/Reg-95 to determine whether the part is in short-circuit protection or not, and then decide whether to program the device to power down the output drivers. However, the device includes further capability to automatically power down an output driver whenever it does into short-circuit protection, without requiring intervention from the user. In this case, the output driver will stay in a power down condition until the user specifically programs it to power down and then power back up again, to clear the short-circuit flag.

JACK / HEADSET DETECTION

The TLV320AIC33 includes extensive capability to monitor a headphone, microphone, or headset jack, determine if a plug has been inserted into the jack, and then determine what type of headset/headphone is wired to the plug. [Figure 36](#) shows one configuration of the device that enables detection and determination of headset type when a pseudo-differential (capless) stereo headphone output configuration is used. The registers used for this function are Page-0/Reg 14, 37, 38, and 13. The type of headset detected can be read back from Page-0/Reg-13. Note that for best results, it is recommended to select a MICBIAS value as high as possible, and to program the output driver common-mode level at a 1.35V or 1.5V level.

Figure 36. Configuration of device for jack detection using a pseudo-differential (capless) headphone output connection.

A modified output configuration used when the output drivers are ac-coupled is shown in Figure 37. Note that in this mode, the device cannot accurately determine the type of headset inserted if a mono or stereo headphone.

Figure 37. Configuration of device for jack detection using an ac-coupled stereo headphone output connection.

An output configuration for the case of the outputs driving fully differential stereo headphones is shown in Figure 38. In this mode there is a requirement on the jack side that either HPLCOM or HPROUT get shorted to ground if the plug is removed, which can be implemented using a spring terminal in a jack. For this mode to function properly, short-circuit detection should be enabled and configured to power-down the drivers if a short-circuit is detected. The registers that control this functionality are in Page-0/Reg-38/Bit-D2-D1.

Figure 38. Configuration of device for jack detection using a fully differential stereo headphone output connection.

GENERAL PURPOSE I/O

AIC33 has two dedicated pins for General Purpose IO. These pins can be used to read status of external signals through register read when configured as General Purpose Input. When configured as General Purpose Output , these pins can also drive logic high or low. Besides these standard GPIO functions, these pins can also be used in a variety of ways such as output for internal clocks and interrupt signals. AIC33 generates a variety of interrupts of use to the host processor such interrupts on jack detection, button press, short circuit detection and AGC noise detection. All these interrupts can be routed individually to the GPIO pins or can be combined by a logical OR. In case of a combined interrupt, user can read an internal status register to find the actual cause of interrupt. When configured as interrupt, AIC33 also offers the flexibility of generating a single pulse or a train of pulses till the interrupt status register is read by the user.

CONTROL REGISTERS

The control registers for the TLV320AIC33 are described in detail below. All registers are 8 bit in width, with D7 referring to the most significant bit of each register, and D0 referring to the least significant bit.

Page 0 / Register 0: Page Select Register

BIT ⁽¹⁾	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D1	X	0000000	Reserved, write only zeros to these register bits
D0	R/W	0	Page Select Bit Writing zero to this bit sets Page-0 as the active page for following register accesses. Writing a one to this bit sets Page-1 as the active page for following register accesses. It is recommended that the user read this register bit back after each write, to ensure that the proper page is being accessed for future register read/writes.

(1) When resetting registers related to routing and volume controls of output drivers, it is recommended to reset them by writing directly to the registers instead of using software reset.

Page 0 / Register 1: Software Reset Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	W	0	Software Reset Bit 0 : Don't Care 1 : Self clearing software reset
D6–D0	W	0000000	Reserved; don't write

Page 0 / Register 2: Codec Sample Rate Select Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D4	R/W	0000	ADC Sample Rate Select 0000: ADC $F_s = F_{sref}/1$ 0001: ADC $F_s = F_{sref}/1.5$ 0010: ADC $F_s = F_{sref}/2$ 0011: ADC $F_s = F_{sref}/2.5$ 0100: ADC $F_s = F_{sref}/3$ 0101: ADC $F_s = F_{sref}/3.5$ 0110: ADC $F_s = F_{sref}/4$ 0111: ADC $F_s = F_{sref}/4.5$ 1000: ADC $F_s = F_{sref}/5$ 1001: ADC $F_s = F_{sref}/5.5$ 1010: ADC $F_s = F_{sref} / 6$ 1011–1111: Reserved, do not write these sequences.
D3-D0	R/W	0000	DAC Sample Rate Select 0000 : DAC $F_s = F_{sref}/1$ 0001 : DAC $F_s = F_{sref}/1.5$ 0010 : DAC $F_s = F_{sref}/2$ 0011 : DAC $F_s = F_{sref}/2.5$ 0100 : DAC $F_s = F_{sref}/3$ 0101 : DAC $F_s = F_{sref}/3.5$ 0110 : DAC $F_s = F_{sref}/4$ 0111 : DAC $F_s = F_{sref}/4.5$ 1000 : DAC $F_s = F_{sref}/5$ 1001: DAC $F_s = F_{sref}/5.5$ 1010: DAC $F_s = F_{sref} / 6$ 1011–1111 : Reserved, do not write these sequences.

Page 0 / Register 3: PLL Programming Register A

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	PLL Control Bit 0: PLL is disabled 1: PLL is enabled
D6–D3	R/W	0010	PLL Q Value 0000: Q = 16 0001 : Q = 17 0010 : Q = 2 0011 : Q = 3 0100 : Q = 4 ... 1110: Q = 14 1111: Q = 15
D2–D0	R/W	000	PLL P Value 000: P = 8 001: P = 1 010: P = 2 011: P = 3 100: P = 4 101: P = 5 110: P = 6 111: P = 7

Page 0 / Register 4: PLL Programming Register B

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D2	R/W	000001	PLL J Value 000000: Reserved, do not write this sequence 000001: J = 1 000010: J = 2 000011: J = 3 ... 111110: J = 62 111111: J = 63
D1–D0	R/W	00	Reserved, write only zeros to these bits

Page 0 / Register 5: PLL Programming Register C⁽¹⁾

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D0	R/W	00000000	PLL D value – Eight most significant bits of a 14-bit unsigned integer valid values for D are from zero to 9999, represented by a 14-bit integer located in Page-0/Reg-5-6. Values should not be written into these registers that would result in a D value outside the valid range.

- (1) Note that whenever the D value is changed, register 5 should be written, immediately followed by register 6. Even if only the MSB or LSB of the value changes, both registers should be written.

Page 0 / Register 6: PLL Programming Register D

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D2	R/W	00000000	PLL D value – Six least significant bits of a 14-bit unsigned integer valid values for D are from zero to 9999, represented by a 14-bit integer located in Page-0/Reg-5-6. Values should not be written into these registers that would result in a D value outside the valid range.
D1–D0	R	00	Reserved, write only zeros to these bits.

Page 0 / Register 7: Codec Datapath Setup Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	Fsref setting This register setting controls timers related to the AGC time constants. 0: Fsref = 48-kHz 1: Fsref = 44.1-kHz
D6	R/W	0	ADC Dual rate control 0: ADC dual rate mode is disabled 1: ADC dual rate mode is enabled Note: ADC Dual Rate Mode must match DAC Dual Rate Mode
D5	R/W	0	DAC Dual Rate Control 0: DAC dual rate mode is disabled 1: DAC dual rate mode is enabled
D4–D3	R/W	00	Left DAC Datapath Control 00: Left DAC datapath is off (muted) 01: Left DAC datapath plays left channel input data 10: Left DAC datapath plays right channel input data 11: Left DAC datapath plays mono mix of left and right channel input data
D2–D1	R/W	00	Right DAC Datapath Control 00: Right DAC datapath is off (muted) 01: Right DAC datapath plays right channel input data 10: Right DAC datapath plays left channel input data 11: Right DAC datapath plays mono mix of left and right channel input data
D0	R/W	0	Reserved. Only write zero to this register.

Page 0 / Register 8: Audio Serial Data Interface Control Register A

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	Bit Clock Directional Control 0: Bit clock is an input (slave mode) 1: Bit clock is an output (master mode)
D6	R/W	0	Word Clock Directional Control 0: Word clock is an input (slave mode) 1: Word clock is an output (master mode)
D5	R/W	0	Serial Output Data Driver (DOOUT) 3-state control 0: Do not 3-state DOOUT when valid data is not being sent 1: 3-state DOOUT when valid data is not being sent
D4	R/W	0	Bit/ Word Clock Drive Control 0: Bit clock and word clock will not be transmitted when in master mode if codec is powered down 1: Bit clock and word clock will continue to be transmitted when in master mode, even if codec is powered down
D3	R/W	0	Reserved. Only write zero to this bit.
D2	R/W	0	3-D Effect Control 0: Disable 3-D digital effect processing 1: Enable 3-D digital effect processing
D1-D0	R/W	00	Digital Microphone Functionality Control 00: Digital microphone support is disabled 01: Digital microphone support is enabled with an oversampling rate of 128 10: Digital microphone support is enabled with an oversampling rate of 64 11: Digital microphone support is enabled with an oversampling rate of 32

Page 0 / Register 9: Audio Serial Data Interface Control Register B

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D6	R/W	00	Audio Serial Data Interface Transfer Mode 00: Serial data bus uses I ² S mode 01: Serial data bus uses DSP mode 10: Serial data bus uses right-justified mode 11: Serial data bus uses left-justified mode
D5–D4	R/W	00	Audio Serial Data Word Length Control 00: Audio data word length = 16-bits 01: Audio data word length = 20-bits 10: Audio data word length = 24-bits 11: Audio data word length = 32-bits
D3	R/W	0	Bit Clock Rate Control This register only has effect when bit clock is programmed as an output 0: Continuous-transfer mode used to determine master mode bit clock rate 1: 256-clock transfer mode used, resulting in 256 bit clocks per frame
D2	R/W	0	DAC Re-Sync 0: Don't Care 1: Re-Sync Stereo DAC with Codec Interface if the group delay changes by more than \pm DACFS/4.
D1	R/W	0	ADC Re-Sync 0: Don't Care 1: Re-Sync Stereo ADC with Codec Interface if the group delay changes by more than \pm ADCFS/4.
D0	R/W		Re-Sync Mute Behavior 0: Re-Sync is done without soft-muting the channel. (ADC/DAC) 1: Re-Sync is done by internally soft-muting the channel. (ADC/DAC)

Page 0 / Register 10: Audio Serial Data Interface Control Register C

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D0	R/W	00000000	<p>Audio Serial Data Word Offset Control This register determines where valid data is placed or expected in each frame, by controlling the offset from beginning of the frame where valid data begins. The offset is measured from the rising edge of word clock when in DSP mode.</p> <p>00000000: Data offset = 0 bit clocks 00000001: Data offset = 1 bit clock 00000010: Data offset = 2 bit clocks ...</p> <p>Note: In continuous transfer mode the maximum offset is 17 for I²S/LJF/RJF modes and 16 for DSP mode. In 256-clock mode, the maximum offset is 242 for I²S/LJF/RJF and 241 for DSP modes.</p> <p>11111110: Data offset = 254 bit clocks 11111111: Data offset = 255 bit clocks</p>

Page 0 / Register 11: Audio Codec Overflow Flag Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R	0	<p>Left ADC Overflow Flag This is a sticky bit, so will stay set if an overflow occurs, even if the overflow condition is removed. The register bit reset to 0 after it is read. 0: No overflow has occurred 1: An overflow has occurred</p>
D6	R	0	<p>Right ADC Overflow Flag This is a sticky bit, so will stay set if an overflow occurs, even if the overflow condition is removed. The register bit reset to 0 after it is read. 0: No overflow has occurred 1: An overflow has occurred</p>
D5	R	0	<p>Left DAC Overflow Flag This is a sticky bit, so will stay set if an overflow occurs, even if the overflow condition is removed. The register bit reset to 0 after it is read. 0: No overflow has occurred 1: An overflow has occurred</p>
D4	R	0	<p>Right DAC Overflow Flag This is a sticky bit, so will stay set if an overflow occurs, even if the overflow condition is removed. The register bit reset to 0 after it is read. 0: No overflow has occurred 1: An overflow has occurred</p>
D3–D0	R/W	0001	<p>PLL R Value 0000: R = 16 0001 : R = 1 0010 : R = 2 0011 : R = 3 0100 : R = 4 ... 1110: R = 14 1111: R = 15</p>

Page 0 / Register 12: Audio Codec Digital Filter Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D6	R/W	00	<p>Left ADC Highpass Filter Control 00: Left ADC highpass filter disabled 01: Left ADC highpass filter –3-dB frequency = 0.0045 × ADC Fs 10: Left ADC highpass filter –3-dB frequency = 0.0125 × ADC Fs 11: Left ADC highpass filter –3-dB frequency = 0.025 × ADC Fs</p>
D5–D4	R/W	00	<p>Right ADC Highpass Filter Control 00: Right ADC highpass filter disabled 01: Right ADC highpass filter –3-dB frequency = 0.0045 × ADC Fs 10: Right ADC highpass filter –3-dB frequency = 0.0125 × ADC Fs 11: Right ADC highpass filter –3-dB frequency = 0.025 × ADC Fs</p>

Page 0 / Register 12: Audio Codec Digital Filter Control Register (continued)

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D3	R/W	0	Left DAC Digital Effects Filter Control 0: Left DAC digital effects filter disabled (bypassed) 1: Left DAC digital effects filter enabled
D2	R/W	0	Left DAC De-emphasis Filter Control 0: Left DAC de-emphasis filter disabled (bypassed) 1: Left DAC de-emphasis filter enabled
D1	R/W	0	Right DAC Digital Effects Filter Control 0: Right DAC digital effects filter disabled (bypassed) 1: Right DAC digital effects filter enabled
D0	R/W	0	Right DAC De-emphasis Filter Control 0: Right DAC de-emphasis filter disabled (bypassed) 1: Right DAC de-emphasis filter enabled

Page 0 / Register 13: Headset / Button Press Detection Register A

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	Headset Detection Control 0: Headset detection disabled 1: Headset detection enabled
D6-D5	R	00	Headset Type Detection Results 00: No headset detected 01: Stereo headset detected 10: Cellular headset detected 11: Stereo + cellular headset detected
D4-D2	R/W	000	Headset Glitch Suppression Debounce Control for Jack Detection 000: Debounce = 16msec(sampled with 2ms clock) 001: Debounce = 32msec(sampled with 4ms clock) 010: Debounce = 64msec(sampled with 8ms clock) 011: Debounce = 128msec(sampled with 16ms clock) 100: Debounce = 256msec(sampled with 32ms clock) 101: Debounce = 512msec(sampled with 64ms clock) 110: Reserved, do not write this bit sequence to these register bits. 111: Reserved, do not write this bit sequence to these register bits.
D1-D0	R/W	00	Headset Glitch Suppression Debounce Control for Button Press 00: Debounce = 0msec 01: Debounce = 8msec(sampled with 1ms clock) 10: Debounce = 16msec(sampled with 2ms clock) 11: Debounce = 32msec(sampled with 4ms clock)

Page 0 / Register 14: Headset / Button Press Detection Register B

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	Driver Capacitive Coupling 0: Programs high-power outputs for capless driver configuration 1: Programs high-power outputs for ac-coupled driver configuration
D6 ⁽¹⁾	R/W	0	Stereo Output Driver Configuration A Note: do not set bits D6 and D3 both high at the same time. 0: A stereo fully-differential output configuration is not being used 1: A stereo fully-differential output configuration is being used
D5	R	0	Button Press Detection Flag This register is a sticky bit, and will stay set to 1 after a button press has been detected, until the register is read. Upon reading this register, the bit is reset to zero. 0: A button press has not been detected 1: A button press has been detected
D4	R	0	Headset Detection Flag 0: A headset has not been detected 1: A headset has been detected

(1) Do not set D6 and D3 to 1 simultaneously

Page 0 / Register 14: Headset / Button Press Detection Register B (continued)

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D3 ⁽¹⁾	R/W	0	Stereo Output Driver Configuration B Note: do not set bits D6 and D3 both high at the same time. 0: A stereo pseudo-differential output configuration is not being used 1: A stereo pseudo-differential output configuration is being used
D2–D0	R	000	Reserved. Write only zeros to these bits.

Page 0 / Register 15: Left ADC PGA Gain Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION

Page 0 / Register 23: LINE2R to Right ADC Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	LINE2R Single-Ended vs Fully Differential Control If LINE2R is selected to both left and right ADC channels, both connections must use the same configuration (single-ended or fully differential mode). 0: LINE2R is configured in single-ended mode 1: LINE2R is configured in fully differential mode
D6–D3	R/W	1111	LINE2R Input Level Control for Right ADC PGA Mix Setting the input level control to a gain below automatically connects LINE2R to the right ADC PGA mix 0000: Input level control gain = 0.0-dB 0001: Input level control gain = –1.5-dB 0010: Input level control gain = –3.0-dB 0011: Input level control gain = –4.5-dB 0100: Input level control gain = –6.0-dB 0101: Input level control gain = –7.5-dB 0110: Input level control gain = –9.0-dB 0111: Input level control gain = –10.5-dB 1000: Input level control gain = –12.0-dB 1001-1110: Reserved. Do not write these sequences to these register bits 1111: LINE2R is not connected to the right ADC PGA
D2	R/W	0	Right ADC Channel Weak Common-Mode Bias Control 0: Right ADC channel unselected inputs are not biased weakly to the ADC common-mode voltage 1: Right ADC channel unselected inputs are biased weakly to the ADC common- mode voltage
D1–D0	R	00	Reserved. Write only zeros to these register bits

Page 0 / Register 24: LINE1L to Right ADC Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	LINE1L Single-Ended vs Fully Differential Control If LINE1L is selected to both left and right ADC channels, both connections must use the same configuration (single-ended or fully differential mode). 0: LINE1L is configured in single-ended mode 1: LINE1L is configured in fully differential mode
D6–D3	R/W	1111	LINE1L Input Level Control for Right ADC PGA Mix Setting the input level control to a gain below automatically connects LINE1L to the right ADC PGA mix 0000: Input level control gain = 0.0-dB 0001: Input level control gain = –1.5-dB 0010: Input level control gain = –3.0-dB 0011: Input level control gain = –4.5-dB 0100: Input level control gain = –6.0-dB 0101: Input level control gain = –7.5-dB 0110: Input level control gain = –9.0-dB 0111: Input level control gain = –10.5-dB 1000: Input level control gain = –12.0-dB 1001–1110: Reserved. Do not write these sequences to these register bits 1111: LINE1L is not connected to the right ADC PGA
D2–D0	R	000	Reserved. Write only zeros to these register bits.

Page 0 / Register 25: MICBIAS Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D6	R/W	00	MICBIAS Level Control 00: MICBIAS output is powered down 01: MICBIAS output is powered to 2.0 V 10: MICBIAS output is powered to 2.5 V 11: MICBIAS output is connected to AVDD
D5–D3	R	000	Reserved. Write only zeros to these register bits.
D2–D0	R	XXX	Reserved. Write only zeros to these register bits.

Page 0 / Register 26: Left AGC Control Register A

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	Left AGC Enable 0: Left AGC is disabled 1: Left AGC is enabled
D6–D4	R/W	000	Left AGC Target Gain 000: Left AGC target gain = –5.5-dB 001: Left AGC target gain = –8-dB 010: Left AGC target gain = –10-dB 011: Left AGC target gain = –12-dB 100: Left AGC target gain = –14-dB 101: Left AGC target gain = –17-dB 110: Left AGC target gain = –20-dB 111: Left AGC target gain = –24-dB

Output Stage Volume Controls

A basic analog volume control with range from 0 dB to -78 dB and mute is replicated multiple times in the output stage network, connected to each of the analog signals that route to the output stage. In addition, to enable completely independent mixing operations to be performed for each output driver, each analog signal coming into the output stage may have up to seven separate volume controls. These volume controls all have approximately 0.5-dB step programmability over most of the gain range, with steps increasing slightly at the lowest attenuations. [Table 4](#) lists the detailed gain versus programmed setting for this basic volume control.

Table 4. Output Stage Volume Control Settings and Gains

Gain Setting	Analog Gain (dB)						
0	0.0	30	-15.0	60	-30.1	90	-45.2
1	-0.5	31	-15.5	61	-30.6	91	-45.8

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	PGA_R Output Routing Control 0: PGA_R is not routed to HPLOUT 1: PGA_R is routed to HPLOUT
D6-D0	R/W	0000000	PGA_R to HPLOUT Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 50: DAC_R1 to HPLOUT Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	DAC_R1 Output Routing Control 0: DAC_R1 is not routed to HPLOUT 1: DAC_R1 is routed to HPLOUT
D6-D0	R/W	0000000	DAC_R1 to HPLOUT Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 51: HPLOUT Output Level Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D4	R/W	0000	HPLOUT Output Level Control 0000: Output level control = 0-dB 0001: Output level control = 1-dB 0010: Output level control = 2-dB ... 1000: Output level control = 8-dB 1001: Output level control = 9-dB 1010–1111: Reserved. Do not write these sequences to these register bits.
D3	R/W	0	HPLOUT Mute 0: HPLOUT is muted 1: HPLOUT is not muted
D2	R/W	1	HPLOUT Power Down Drive Control 0: HPLOUT is weakly driven to a common-mode when powered down 1: HPLOUT is tri-stated with powered down
D1	R	0	HPLOUT Volume Control Status 0: All programmed gains to HPLOUT have been applied 1: Not all programmed gains to HPLOUT have been applied yet
D0	R/W	0	HPLOUT Power Control 0: HPLOUT is not fully powered up 1: HPLOUT is fully powered up

Page 0 / Register 52: LINE2L to HPLCOM Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	LINE2L Output Routing Control 0: LINE2L is not routed to HPLCOM 1: LINE2L is routed to HPLCOM
D6-D0	R/W	0000000	LINE2L to HPLCOM Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 53: PGA_L to HPLCOM Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	PGA_L Output Routing Control 0: PGA_L is not routed to HPLCOM 1: PGA_L is routed to HPLCOM
D6-D0	R/W	0000000	PGA_L to HPLCOM Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 54: DAC_L1 to HPLCOM Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	DAC_L1 Output Routing Control 0: DAC_L1 is not routed to HPLCOM 1: DAC_L1 is routed to HPLCOM
D6-D0	R/W	0000000	DAC_L1 to HPLCOM Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 55: LINE2R to HPLCOM Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	LINE2R Output Routing Control 0: LINE2R is not routed to HPLCOM 1: LINE2R is routed to HPLCOM
D6-D0	R/W	0000000	LINE2R to HPLCOM Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 56: PGA_R to HPLCOM Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	PGA_R Output Routing Control 0: PGA_R is not routed to HPLCOM 1: PGA_R is routed to HPLCOM
D6-D0	R/W	0000000	PGA_R to HPLCOM Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 57: DAC_R1 to HPLCOM Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	DAC_R1 Output Routing Control 0: DAC_R1 is not routed to HPLCOM 1: DAC_R1 is routed to HPLCOM
D6-D0	R/W	0000000	DAC_R1 to HPLCOM Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 58: HPLCOM Output Level Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D4	R/W	0000	HPLCOM Output Level Control 0000: Output level control = 0-dB 0001: Output level control = 1-dB 0010: Output level control = 2-dB ... 1000: Output level control = 8-dB 1001: Output level control = 9-dB 1010–1111: Reserved. Do not write these sequences to these register bits.
D3	R/W	0	HPLCOM Mute 0: HPLCOM is muted 1: HPLCOM is not muted
D2	R/W	1	HPLCOM Power Down Drive Control 0: HPLCOM is weakly driven to a common-mode when powered down 1: HPLCOM is tri-stated with powered down
D1	R	0	HPLCOM Volume Control Status 0: All programmed gains to HPLCOM have been applied 1: Not all programmed gains to HPLCOM have been applied yet
D0	R/W	0	HPLCOM Power Control 0: HPLCOM is not fully powered up 1: HPLCOM is fully powered up

Page 0 / Register 59: LINE2L to HPROUT Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	LINE2L Output Routing Control 0: LINE2L is not routed to HPROUT 1: LINE2L is routed to HPROUT
D6-D0	R/W	0000000	LINE2L to HPROUT Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 60: PGA_L to HPROUT Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	PGA_L Output Routing Control 0: PGA_L is not routed to HPROUT 1: PGA_L is routed to HPROUT
D6-D0	R/W	0000000	PGA_L to HPROUT Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 61: DAC_L1 to HPROUT Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	DAC_L1 Output Routing Control 0: DAC_L1 is not routed to HPROUT 1: DAC_L1 is routed to HPROUT
D6-D0	R/W	0000000	DAC_L1 to HPROUT Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 62: LINE2R to HPROUT Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	LINE2R Output Routing Control 0: LINE2R is not routed to HPROUT 1: LINE2R is routed to HPROUT
D6-D0	R/W	0000000	LINE2R to HPROUT Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 63: PGA_R to HPROUT Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	PGA_R Output Routing Control 0: PGA_R is not routed to HPROUT 1: PGA_R is routed to HPROUT
D6-D0	R/W	0000000	PGA_R to HPROUT Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 64: DAC_R1 to HPROUT Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	DAC_R1 Output Routing Control 0: DAC_R1 is not routed to HPROUT 1: DAC_R1 is routed to HPROUT
D6-D0	R/W	0000000	DAC_R1 to HPROUT Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 65: HPROUT Output Level Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D4	R/W	0000	HPROUT Output Level Control 0000: Output level control = 0-dB 0001: Output level control = 1-dB 0010: Output level control = 2-dB ... 1000: Output level control = 8-dB 1001: Output level control = 9-dB 1010–1111: Reserved. Do not write these sequences to these register bits.
D3	R/W	0	HPROUT Mute 0: HPROUT is muted 1: HPROUT is not muted
D2	R/W	1	HPROUT Power Down Drive Control 0: HPROUT is weakly driven to a common-mode when powered down 1: HPROUT is tri-stated with powered down
D1	R	0	HPROUT Volume Control Status 0: All programmed gains to HPROUT have been applied 1: Not all programmed gains to HPROUT have been applied yet
D0	R/W	0	HPROUT Power Control 0: HPROUT is not fully powered up 1: HPROUT is fully powered up

Page 0 / Register 66: LINE2L to HPRCOM Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	LINE2L Output Routing Control 0: LINE2L is not routed to HPRCOM 1: LINE2L is routed to HPRCOM
D6-D0	R/W	0000000	LINE2L to HPRCOM Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 67: PGA_L to HPRCOM Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	PGA_L Output Routing Control 0: PGA_L is not routed to HPRCOM 1: PGA_L is routed to HPRCOM
D6-D0	R/W	0000000	PGA_L to HPRCOM Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 68: DAC_L1 to HPRCOM Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	DAC_L1 Output Routing Control 0: DAC_L1 is not routed to HPRCOM 1: DAC_L1 is routed to HPRCOM
D6-D0	R/W	0000000	DAC_L1 to HPRCOM Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 69: LINE2R to HPRCOM Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	LINE2R Output Routing Control 0: LINE2R is not routed to HPRCOM 1: LINE2R is routed to HPRCOM
D6-D0	R/W	0000000	LINE2R to HPRCOM Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 70: PGA_R to HPRCOM Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	PGA_R Output Routing Control 0: PGA_R is not routed to HPRCOM 1: PGA_R is routed to HPRCOM
D6-D0	R/W	0000000	PGA_R to HPRCOM Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 71: DAC_R1 to HPRCOM Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	DAC_R1 Output Routing Control 0: DAC_R1 is not routed to HPRCOM 1: DAC_R1 is routed to HPRCOM
D6-D0	R/W	0000000	DAC_R1 to HPRCOM Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 72: HPRCOM Output Level Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D4	R/W	0000	HPRCOM Output Level Control 0000: Output level control = 0-dB 0001: Output level control = 1-dB 0010: Output level control = 2-dB ... 1000: Output level control = 8-dB 1001: Output level control = 9-dB 1010–1111: Reserved. Do not write these sequences to these register bits.
D3	R/W	0	HPRCOM Mute 0: HPRCOM is muted 1: HPRCOM is not muted
D2	R/W	1	HPRCOM Power Down Drive Control 0: HPRCOM is weakly driven to a common-mode when powered down 1: HPRCOM is tri-stated with powered down
D1	R	0	HPRCOM Volume Control Status 0: All programmed gains to HPRCOM have been applied 1: Not all programmed gains to HPRCOM have been applied yet
D0	R/W	0	HPRCOM Power Control 0: HPRCOM is not fully powered up 1: HPRCOM is fully powered up

Page 0 / Register 73: LINE2L to MONO_LOP/M Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	LINE2L Output Routing Control 0: LINE2L is not routed to MONO_LOP/M 1: LINE2L is routed to MONO_LOP/M
D6-D0	R/W	0000000	LINE2L to MONO_LOP/M Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 74: PGA_L to MONO_LOP/M Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	PGA_L Output Routing Control 0: PGA_L is not routed to MONO_LOP/M 1: PGA_L is routed to MONO_LOP/M
D6-D0	R/W	0000000	PGA_L to MONO_LOP/M Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 75: DAC_L1 to MONO_LOP/M Volume Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	0	DAC_L1 Output Routing Control 0: DAC_L1 is not routed to MONO_LOP/M 1: DAC_L1 is routed to MONO_LOP/M
D6-D0	R/W	0000000	DAC_L1 to MONO_LOP/M Analog Volume Control For 7-bit register setting versus analog gain values, see Table 4

Page 0 / Register 76: LINE2R to MONO_LOP/M Volume Control Register

D2	R	0	Headset Detection Status 0: No Headset is detected 1: Headset is detected
D1	R	0	Left ADC AGC Noise Gate Status 0: Left ADC Signal Power Greater than Noise Threshold for Left AGC 1: Left ADC Signal Power Lower than Noise Threshold for Left AGC
D0	R	0	Right ADC AGC Noise Gate Status 0: Right ADC Signal Power Greater than Noise Threshold for Right AGC 1: Right ADC Signal Power Lower than Noise Threshold for Right AGC

(1) This bit is a sticky bit, cleared only when page 0, register 14 is read.

Page 0 / Register 98: GPIO1 Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D4	R/W	0000	GPIO1 Output Control 0000: GPIO1 is disabled 0001: GPIO1 used for audio serial data bus ADC word clock 0010: GPIO1 output = clock mux output divided by 1 (M=1) 0011: GPIO1 output = clock mux output divided by 2 (M=2) 0100: GPIO1 output = clock mux output divided by 4 (M=4) 0101: GPIO1 output = clock mux output divided by 8 (M=8) 0110: GPIO1 output = short circuit interrupt 0111: GPIO1 output = AGC noise interrupt 1000: GPIO1 = general purpose input 1001: GPIO1 = general purpose output 1010: GPIO1 output = digital microphone modulator clock 1011: GPIO1 = word clock for audio serial data bus (programmable as input or output) 1100: GPIO1 output = hook-switch/button press interrupt (interrupt polarity: active high, typical interrupt duration: button pressed time + clock resolution. Clock resolution depends upon debounce programmability. Typical interrupt delay from button: debounce duration + 0.5ms) 1101: GPIO1 output = jack/headset detection interrupt 1110: GPIO1 output = jack/headset detection interrupt OR button press interrupt 1111: GPIO1 output = jack/headset detection OR button press OR Short Circuit detection OR AGC Noise detection interrupt
D3	R/W	0	GPIO1 Clock Mux Output Control 0: GPIO1 clock mux output = PLL output 1: GPIO1 clock mux output = clock divider mux output

Page 0 / Register 98: GPIO1 Control Register (continued)

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D2	R/W	0	GPIO1 Interrupt Duration Control 0: GPIO1 Interrupt occurs as a single active-high pulse of typical duration 2ms. 1: GPIO1 Interrupt occurs as continuous pulses until the Interrupt Flags register (register 96) is read by the host
D1	R	0	GPIO1 General Purpose Input Value 0: A logic-low level is input to GPIO1 1: A logic-high level is input to GPIO1
D0	R/W	0	GPIO1 General Purpose Output Value 0: GPIO1 outputs a logic-low level 1: GPIO1 outputs a logic-high level

Page 0 / Register 99: GPIO2 Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D4	R/W	0000	GPIO2 Output Control 0000: GPIO2 is disabled 0001: Reserved. Do not use. 0010: GPIO2 output = jack/headset detect interrupt (interrupt polarity: active high. Typical interrupt duration: 1.75 ms.) 0011: GPIO2 = general purpose input 0100: GPIO2 = general purpose output 0101-0111: GPIO2 input = digital microphone input, data sampled on clock rising and falling edges 1000: GPIO2 = bit clock for audio serial data bus (programmable as input or output) 1001: GPIO2 output = Headset Detect OR Button Press Interrupt 1010: GPIO2 output = Headset Detect OR Button Press OR Short-Circuit Detect OR AGC Noise Detect Interrupt 1011: GPIO2 output = Short Circuit Detect OR AGC Noise Detect Interrupt 1100: GPIO2 output = Headset Detect OR Button Press OR Short-Circuit Detect Interrupt 1101: GPIO2 output = Short Circuit Detect Interrupt 1110: GPIO2 output = AGC Noise Detect Interrupt 1111: GPIO2 output = Button Press / Hookswitch Interrupt
D3	R/W	0	GPIO2 General Purpose Output Value 0: GPIO1 outputs a logic-low level 1: GPIO1 outputs a logic-high level
D2	R	0	GPIO2 General Purpose Input Value 0: A logic-low level is input to GPIO2 1: A logic-high level is input to GPIO2
D1	R/W	0	GPIO2 Interrupt Duration Control 0: GPIO2 Interrupt occurs as a single active-high pulse of typical duration 2ms. 1: GPIO2 Interrupt occurs as continuous pulses until the Interrupt Flags register (register 96) is read by the host
D0	R/W	0	Reserved. Write only zero to this register bit.

Page 0 / Register 100: Additional GPIO Control Register A

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D6	R/W	00	SDA Pin Control ⁽¹⁾ The SDA pin hardware includes pull-down capability only (open-drain NMOS), so an external pull-up resistor is required when using this pin, even in GPIO mode. 00: SDA pin is not used as general purpose I/O 01: SDA pin used as general purpose input 10: SDA pin used as general purpose output 11: Reserved. Do not write this sequence to these register bits.
D5	R/W	0	SDA General Purpose Output Control ⁽¹⁾ 0: SDA driven to logic-low when used as general purpose output 1: SDA driven to logic-high when used as general purpose output (requires external pull-up resistor)

(1) The control bits in Register 100 are only valid in SPI Mode, when SELECT=1.

Page 0 / Register 100: Additional GPIO Control Register A (continued)

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D4	R	0	SDA General Purpose Input Value ⁽¹⁾ 0: SDA detects a logic-low when used as general purpose input 1: SDA is detects a logic-high when used as general purpose input
D3-D2	R/W	00	SCL Pin Control ⁽¹⁾ The SCL pin hardware includes pulldown capability only (open-drain NMOS), so an external pull-up resistor is required when using this pin, even in GPIO mode. 00: SCL pin is not used as general purpose I/O 01: SCL pin used as general purpose input 10: SCL pin used as general purpose output 11: Reserved. Do not write this sequence to these register bits.
D1	R/W	0	SCL General Purpose Output Control ⁽¹⁾ 0: SCL driven to logic-low when used as general purpose output 1: SCL driven to logic-high when used as general purpose output (requires external pull-up resistor)
D0	R	0	SCL General Purpose Input Value ⁽¹⁾ 0: SCL detects a logic-low when used as general purpose input 1: SCL detects a logic-high when used as general purpose input

Page 0 / Register 101: Additional GPIO Control Register B

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R	0	I ² C Address Pin #0 Status ⁽¹⁾ 0: MFP1 pin = I ² C address pin #0 = 0 at reset 1: MFP1 pin = I ² C address pin #0 = 1 at reset
D6	R	0	I ² C Address Pin #1 Status ⁽¹⁾ 0: MFP0 pin = I ² C address pin #1 = 0 at reset 1: MFP0 pin = I ² C address pin #1 = 1 at reset
D5	R/W	0	MFP3 Pin General Purpose Input Control ⁽¹⁾ 0: MFP3 pin usage as general purpose input is disabled 1: MFP3 pin usage as general purpose input is enabled
D4	R/W	0	MFP3 Pin Serial Data Bus Input Control ⁽¹⁾ 0: MFP3 pin usage as audio serial data input pin is disabled 1: MFP3 pin usage as audio serial data input pin is enabled
D3	R	0	MFP3 General Purpose Input Value ⁽¹⁾ 0: MFP3 detects a logic-low when used as general purpose input 1: MFP3 detects a logic-high when used as general purpose input
D2	R/W	0	MFP2 General Purpose Output Control ⁽¹⁾ 0: MFP2 pin usage as general purpose output is disabled 1: MFP2 pin usage as general purpose output is enabled
D1	R/W	0	MFP2 General Purpose Output Control ⁽¹⁾ 0: MFP2 pin drives a logic-low when used as a general purpose output 1: MFP2 pin drives a logic-high when used as a general purpose output
D0	R/W	0	CODEC_CLKIN Source Selection 0: CODEC_CLKIN uses PLLDIV_OUT 1: CODEC_CLKIN uses CLKDIV_OUT

(1) Bits D7-D1 in Register 101 are only valid in I²C control Mode, when SELECT = 0.

Page 0 / Register 102: Clock Generation Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D6	R/W	00	CLKDIV_IN Source Selection 00: CLKDIV_IN uses MCLK 01: CLKDIV_IN uses GPIO2 10: CLKDIV_IN uses BCLK 11: Reserved. Do not use.

Page 0 / Register 102: Clock Generation Control Register (continued)

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D5-D4	R/W	00	PLLCLK_IN Source Selection 00: PLLCLK_IN uses MCLK 01: PLLCLK_IN uses GPIO2 10: PLLCLK_IN uses BCLK 11: Reserved. Do not use.
D3-D0	R/W	0010	PLL Clock Divider N Value 0000: N=16 0001: N=17 0010: N=2 0011: N=3 ... 1111: N=15

Page 0 / Register 103–127: Reserved Registers

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R	00000000	Reserved. Do not write to these registers.

Page 1 / Register 0: Page Select Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D1	X	00000000	Reserved, write only zeros to these register bits
D0	R/W	0	Page Select Bit Writing zero to this bit sets Page-0 as the active page for following register accesses. Writing a one to this bit sets Page-1 as the active page for following register accesses. It is recommended that the user read this register bit back after each write, to ensure that the proper page is being accessed for future register read/writes. This register has the same functionality on page-0 and page-1.

Page 1 / Register 1: Left Channel Audio Effects Filter N0 Coefficient MSB Register⁽¹⁾

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x6B	Left Channel Audio Effects Filter N0 Coefficient MSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from –32768 to +32767.

(1) Note that whenever any coefficient value is changed, the MSB register should be written first, immediately followed by the LSB register. Even if only the MSB or LSB of the value changes, both registers should be written

Page 1 / Register 2: Left Channel Audio Effects Filter N0 Coefficient LSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0xE3	Left Channel Audio Effects Filter N0 Coefficient LSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from –32768 to +32767.

Page 1 / Register 3: Left Channel Audio Effects Filter N1 Coefficient MSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x96	Left Channel Audio Effects Filter N1 Coefficient MSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from –32768 to +32767.

Page 1 / Register 4: Left Channel Audio Effects Filter N1 Coefficient LSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x66	Left Channel Audio Effects Filter N1 Coefficient LSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 5: Left Channel Audio Effects Filter N2 Coefficient MSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x67	Left Channel Audio Effects Filter N2 Coefficient MSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 6: Left Channel Audio Effects Filter N2 Coefficient LSB

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x5D	Left Channel Audio Effects Filter N2 Coefficient LSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 7: Left Channel Audio Effects Filter N3 Coefficient MSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x6B	Left Channel Audio Effects Filter N3 Coefficient MSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 8: Left Channel Audio Effects Filter N3 Coefficient LSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0xE3	Left Channel Audio Effects Filter N3 Coefficient LSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 9: Left Channel Audio Effects Filter N4 Coefficient MSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x96	Left Channel Audio Effects Filter N4 Coefficient MSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 10: Left Channel Audio Effects Filter N4 Coefficient LSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x66	Left Channel Audio Effects Filter N4 Coefficient LSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 11: Left Channel Audio Effects Filter N5 Coefficient MSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x67	Left Channel Audio Effects Filter N5 Coefficient MSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 12: Left Channel Audio Effects Filter N5 Coefficient LSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x5D	Left Channel Audio Effects Filter N5 Coefficient LSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 13: Left Channel Audio Effects Filter D1 Coefficient MSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x7D	Left Channel Audio Effects Filter D1 Coefficient MSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 14: Left Channel Audio Effects Filter D1 Coefficient LSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x83	Left Channel Audio Effects Filter D1 Coefficient LSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 15: Left Channel Audio Effects Filter D2 Coefficient MSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x84	Left Channel Audio Effects Filter D2 Coefficient MSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 16: Left Channel Audio Effects Filter D2 Coefficient LSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0xEE	Left Channel Audio Effects Filter D2 Coefficient LSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 17: Left Channel Audio Effects Filter D4 Coefficient MSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x7D	Left Channel Audio Effects Filter D4 Coefficient MSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 18: Left Channel Audio Effects Filter D4 Coefficient LSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x83	Left Channel Audio Effects Filter D4 Coefficient LSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 19: Left Channel Audio Effects Filter D5 Coefficient MSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x84	Left Channel Audio Effects Filter D5 Coefficient MSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from -32768 to +32767.

Page 1 / Register 20: Left Channel Audio Effects Filter D5 Coefficient LSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0xEE	Left Channel Audio Effects Filter D5 Coefficient LSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from –32768 to +32767.

Page 1 / Register 21: Left Channel De-emphasis Filter N0 Coefficient MSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x39	Left Channel De-emphasis Filter N0 Coefficient MSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from –32768 to +32767.

Page 1 / Register 22: Left Channel De-emphasis Filter N0 Coefficient LSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x55	Left Channel De-emphasis Filter N0 Coefficient LSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from –32768 to +32767.

Page 1 / Register 23: Left Channel De-emphasis Filter N1 Coefficient MSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0xF3	Left Channel De-emphasis Filter N1 Coefficient MSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from –32768 to +32767.

Page 1 / Register 24: Left Channel De-emphasis Filter N1 Coefficient LSB Register

D7-D0	R/W	0x2D	Right Channel De-emphasis Filter N1 Coefficient LSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from –32768 to +32767.

Page 1 / Register 51: Right Channel De-emphasis Filter D1 Coefficient MSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x53	Right Channel De-emphasis Filter A0 Coefficient MSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from –32768 to +32767.

Page 1 / Register 52: Right Channel De-emphasis Filter D1 Coefficient LSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x7E	Right Channel De-emphasis Filter A0 Coefficient LSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from –32768 to +32767.

Page 1 / Register 53: 3-D Attenuation Coefficient MSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0x7F	3-D Attenuation Coefficient MSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from –32768 to +32767.

Page 1 / Register 54: 3-D Attenuation Coefficient LSB Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R/W	0xFF	3-D Attenuation Coefficient LSB The 16-bit integer contained in the MSB and LSB registers for this coefficient are interpreted as a 2's complement integer, with possible values ranging from –32768 to +32767.

Page 1 / Register 55–127: Reserved Registers

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7-D0	R	0x00	Reserved. Do not write to these registers.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TLV320AIC33IRGZR	VQFN	RGZ	48	2500	330.0	16.4	7.3	7.3	1.5	12.0	16.0	Q2
TLV320AIC33IRGZT	VQFN	RGZ	48	250	180.0	16.4	7.3	7.3	1.5	12.0	16.0	Q2

GENERIC PACKAGE VIEW

RGZ 48

VQFN - 1 mm max height

7 x 7, 0.5 mm pitch

PLASTIC QUADFLAT PACK- NO LEAD

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4224671/A

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

RGZ0048A

VQFN - 1 mm max height

PLASTIC QUADFLAT PACK- NO LEAD

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
