## CIPOS™

# Control Integrated Power System

*Dual In-Line Intelligent Power Module*

*Three Phase Interleaved PFC 650V / 20A*

## Features

Dual In-Line molded module

- TRENCHSTOP™ 5
- Rapid switching emitter controlled diode
- Rugged SOI gate driver technology with stability against transient
- Over current shutdown
- Under-voltage lockout
- All of 3 switches turn off during protection
- Temperature monitor
- Emitter pins accessible for all phase current monitoring (open emitter)
- Lead-free terminal plating; RoHS compliant
- Very low thermal resistance due to DCB

## Target Applications

- 3-Phase Interleaved PFC

## Description

The CIPOS™ module family offers the chance for integrating various power and control components to increase reliability, optimize PCB size and system costs.

It is designed to enhance the system efficiency by improvement of power factor. The package concept is specially adapted to power applications, which need good thermal conduction and electrical isolation, but also EMI-save control and overload protection.

TRENCHSTOP™ 5 are combined with an optimized SOI gate driver for excellent electrical performance.

## System Configuration

- 3-Phase Interleaved PFC with TRENCHSTOP™ 5 and Rapid switching emitter controlled diode
- SOI gate driver
- Thermistor
- Pin-to-heatsink clearance distance typ. 1.6mm

## Pin Description

### LIN(X, Y, Z) (IGBT control pins, Pin 7, 8, 9)

These pins are positive logic and they are responsible for the control of the integrated IGBT. The Schmitt-trigger input thresholds of them are such to guarantee LSTTL and CMOS compatibility down to 3.3V controller outputs. Pull-down resistor of about  $5k\Omega$  is internally provided to pre-bias inputs during supply start-up and a zener clamp is provided for pin protection purposes. Input Schmitt-trigger and noise filter provide beneficial noise rejection to short input pulses.

The noise filter suppresses control pulses which are below the filter time  $t_{FILIN}$ . The filter acts according to Figure 4.

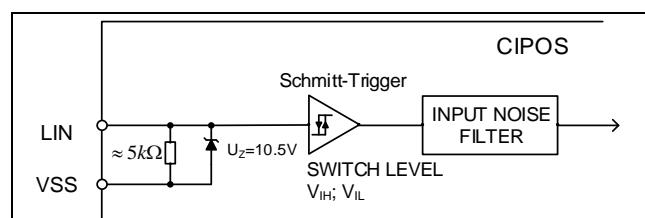

Figure 3 Input pin structure

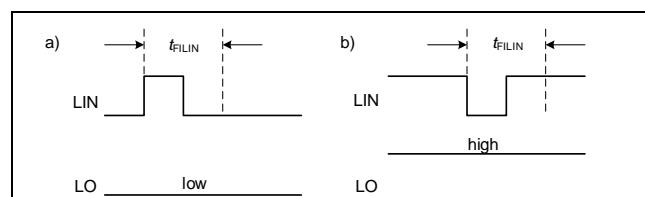

Figure 4 Input filter timing diagram

It is recommended for proper work of this product not to provide input pulse-width lower than  $1\mu\text{s}$ .

#### VFO (Fault-output, Pin 12)

The VFO pin indicates a module failure in case of under voltage at pin VDD or in case of triggered over current detection at ITRIP.

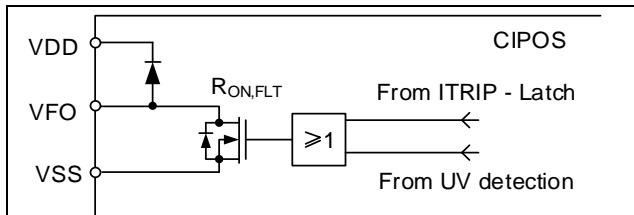

Figure 5 Internal circuit at pin VFO

#### NTC (Thermistor, Pin 15)

The NTC pin provides direct access to thermistor, which is referenced to VSS. An external pull-up resistor connected to +5V ensures that the resulting voltage can be directly connected to the microcontroller.

#### ITRIP (Over current detection function, Pin 13)

CIPOS™ provides an over current detection function by connecting the ITRIP input with the IGBT collector current feedback. The ITRIP comparator threshold (typ. 0.47V) is referenced to VSS ground. An input noise filter (typ.:  $t_{\text{ITRIPMIN}} = 530\text{ns}$ ) prevents the driver to detect false over-current events.

Over current detection generates a shutdown of all outputs of the gate driver after the shutdown propagation delay of typically 1000ns.

#### VDD, VSS (Control supply and reference, Pin 11, 14)

VDD is the control supply and it provides power both to input logic and to output power stage. Input logic is referenced to VSS ground.

The under-voltage circuit enables the device to operate at power on when a supply voltage of at least a typical voltage of  $\text{VDD}_{\text{UV+}} = 12.1\text{V}$  is present.

The IC shuts down all the gate drivers power outputs, when the VDD supply voltage is below  $\text{VDD}_{\text{UV-}} = 10.4\text{V}$ . This prevents the external power switches from critically low gate voltage levels during on-state and therefore from excessive power dissipation.

#### NX, NY, NZ (IGBT emitter, Pin 17, 19, 21)

The IGBT emitters are available for current measurements of each phase. It is recommended to keep the connection to pin VSS as short as possible in order to avoid unnecessary inductive voltage drops.

#### X, Y, Z (IGBT collector, Pin 18, 20, 22)

These pins are IGBT collector. It is mandatory to connect anti-parallel diode between IGBT collector and emitter.

#### P (Positive output voltage, Pin 23)

The diode cathodes are connected to the output voltage. It is noted that the voltage does not exceed 450 V.

## Absolute Maximum Ratings

## Circuit of a Typical Application

**Figure 9** Typical application circuit

Because CIPOS™ Mini PFC has very high speed switching characteristics, considerable large surge voltage between P and N terminals and switching noise on signaling path are generated easily. Please pay attention to the below items for optimized application circuit design.

### 1. Input circuit

- To reduce input signal noise by high speed switching, the  $R_{IN}$  and  $C_{IN}$  filter circuit should be mounted. ( $100\Omega$ ,  $1nF$ )
- $C_{IN}$  should be placed as close to  $V_{SS}$  pin as possible.

### 2. Itrip circuit

- To prevent protection function errors,  $C_{ITRIP}$  should be placed as close to Itrip and  $V_{SS}$  pins as possible.

### 3. VFO circuit

- VFO output is an open drain output. This signal line should be pulled up to the positive side of the 5V/3.3V logic power supply with a proper resistor  $R_{PU}$ . It is recommended that RC filter be placed as close to the controller as possible.

### 4. Snubber capacitor

- The wiring between CIPOS™ Mini PFC and snubber capacitor including shunt resistor should be as short as possible.

### 5. Shunt resistor

- The shunt resistor of SMD type should be used for reducing its stray inductance.

### 6. Ground pattern

- Ground pattern should be separated at only one point of shunt resistor as short as possible.

### 7. It is mandatory to connect anti-parallel diode (2A, voltage rating higher than 650V) to PFC IGBT.

### 8. Input surge voltage protection circuit

- This protection circuit is necessary for PFC IGBT to be protected from excessive surge voltage.
